**CONTENTS**

**YOUNG INFANT**

**IMCI process for all Young Infants** 2

1. **Assess, Classify and Identify Treatment**
   - Possible Bacterial Infection 3
   - Jaundice 3
   - Diarrhoea 4
   - Congenital problems 5
   - Risk Factors 6
   - HIV Infection 7
   - Feeding and Growth 8
   - Feeding and Growth in non-breastfed Infants 9
   - Immunisation Status 10
   - Other Problems 10
   - Caregiver’s health 10
   - Maternal Danger Signs 10

2. **Treat the Young Infant**
   - Prevent Low Blood Sugar... 11
   - Treat Low Blood Sugar 11
   - Give Oxygen 11
   - Keep the infant or child warm 11
   - Ceftriaxone 11
   - Penicillin 11
   - Cephalexin 12
   - Give ARV prophylaxis: nevirapine (NVP) 12
   - Give ARV prophylaxis: zidovudine (AZT). 12
   - Diarrhoea 12
   - Local Infections 12

3. **Counsel the Caregiver**
   - Advise Caregiver to Give Home Care 14
   - When to Return 14

4. **Give Follow-up Care**
   - Local Bacterial Infection 15
   - Jaundice 15
   - Feeding Problems 15
   - Poor Growth 15
   - Thrush 15

5. **Counsels the Mother or Caregiver on Infant and Young Child Feeding**
   - Support mothers to breastfeed successfully 16
   - Breastfeeding Assessment 16
   - Support on expressing breastmilk and cup feeding 16
   - Counsel the caregiver about giving replacement feeds 16

6. **Communicate Skills**
   - Correct volumes and frequency of feeds 20
   - Appetite test 20
   - Feeding Assessment 21
   - Counsel the caregiver about Giving Problems 22
   - Feeding Recommendations from 6 months 23

7. **Salbutamol for Wheeze** 40
   - Paracetamol 40
   - Iron 41
   - Ready to Use Therapeutic Food (RUTF). 20 & 41
   - Multivitamins 41
   - Zinc 41
   - Plan A: Treat for Diarrhoea at Home 42
   - Plan B: Treat for Some Dehydration with ORS. 42
   - Plan C: Treat Severe Dehydration 43

8. **Treat for Local Infections**
   - Dry the Ear by wicking 44
   - Mouth ulcers 44
   - Thrush 44
   - Soothe the Throat, relieve the cough 44
   - Eye Infection 44

9. **Counsel the Caregiver**
   - Advise Caregiver to Give Home Care 45-46
   - When to Return 45

10. **Give Follow-up Care**
    - Pneumonia 47
    - Wheeze 47
    - Diarrhoea 47
    - Persistent Diarrhoea 47
    - Dysentery 47
    - Not Growing Well 48
    - Feeding problem 48
    - Anaemia 48
    - Acute Malnutrition 48
    - Fever - other cause 49
    - Malaria or Suspected Malaria 49
    - Ear infection 49
    - Possible Streptococcal Infection 49
    - Measles 49
    - HIV Infection not on ART 49
    - Ongoing HIV exposure 49
    - HIV-exposed 49

11. **Counsel the Mother or Caregiver on Infant and Young Child Feeding**
    - Support mothers to breastfeed successfully 16
    - Breastfeeding Assessment 17
    - Support on expressing breastmilk and cup feeding 17
    - Counsel the caregiver about giving replacement feeds 18

12. **Communication Skills**
    - Correct volumes and frequency of feeds 20
    - Appetite test 20
    - Feeding Assessment 21
    - Counsel the caregiver about Giving Problems 22
    - Feeding Recommendations from 6 months 23

13. **Salbutamol for Wheeze** 40
    - Paracetamol 40
    - Iron 41
    - Ready to Use Therapeutic Food (RUTF). 20 & 41
    - Multivitamins 41
    - Zinc 41
    - Plan A: Treat for Diarrhoea at Home 42
    - Plan B: Treat for Some Dehydration with ORS. 42
    - Plan C: Treat Severe Dehydration 43

14. **Treat for Local Infections**
    - Dry the Ear by wicking 44
    - Mouth ulcers 44
    - Thrush 44
    - Soothe the Throat, relieve the cough 44
    - Eye Infection 44

15. **Counsel the Caregiver**
    - Advise Caregiver to Give Home Care 45-46
    - When to Return 45

16. **Give Follow-up Care**
    - Pneumonia 47
    - Wheeze 47
    - Diarrhoea 47
    - Persistent Diarrhoea 47
    - Dysentery 47
    - Not Growing Well 48
    - Feeding problem 48
    - Anaemia 48
    - Acute Malnutrition 48
    - Fever - other cause 49
    - Malaria or Suspected Malaria 49
    - Ear infection 49
    - Possible Streptococcal Infection 49
    - Measles 49
    - HIV Infection not on ART 50
    - Ongoing HIV exposure 50
    - HIV-exposed 50
    - Suspected Symptomatic HIV infection 50
    - Confirmed or Probable TB. 51
    - TB exposure or infection 51
    - Palliative Care for Children 51

17. **SKIN PROBLEMS**
    - If skin is itching 61
    - If skin has blisters/sores/pustules 62
    - Non-itchy skin rash 63
    - Drug and allergic reactions 64

18. **ANTIRETROVIRAL THERAPY (ART)**
    - Initiating ART in Children: follow the 6 steps 52
    - Adapted WHO Clinical Staging 53
    - First line ART: regimens for children 53
    - Follow-up care for children on ART: follow the 7 steps 54-56
    - Routine laboratory tests 58
    - Side-effects of ART 60

19. **IMCI PROCESS FOR ALL YOUNG INFANTS (Birth up to two months)**

20. **TREAT FOR LOCAL INFECTIONS**
    - Dry the Ear by wicking 44
    - Mouth ulcers 44
    - Thrush 44
    - Soothe the Throat, relieve the cough 44
    - Eye Infection 44

21. **COUNSEL THE MOTHER OR CAREGIVER ON INFANT AND YOUNG CHILD FEEDING (BIRTH UP TO 2 MONTHS)**
    - Support mothers to breastfeed successfully 16
    - Breastfeeding Assessment 17
    - Support on expressing breastmilk and cup feeding 17
    - Counsel the caregiver about giving replacement feeds 18

22. **COMMUNICATION SKILLS**
    - Correct volumes and frequency of feeds 20
    - Appetite test 20
    - Feeding Assessment 21
    - Counsel the caregiver about Giving Problems 22
    - Feeding Recommendations from 6 months 23
IMCI PROCESS FOR ALL YOUNG INFANTS
(Birth up to two months)

HAS THE INFANT JUST BEEN DELIVERED?

YES

• Provide Emergency Newborn Care
• Resuscitate using the Helping Babies Breathe (HBB) approach.
• Keep baby warm (p. 11)
• ASSESS and CLASSIFY for POSSIBLE SERIOUS BACTERIAL INFECTION and provide any treatments (p. 3)
• Support mother to initiate breastfeeding (p. 17 - 18)
• Refer to maternity unit/hospital

NO

• GREET THE CAREGIVER
• ASK: Why the caregiver has brought the child to the health facility today?
• DETERMINE IF THIS IS AN INITIAL, FOLLOW UP or ROUTINE VISIT
• Ensure that an infant who has come for an INITIAL VISIT (i.e. because they are sick) is fast-tracked.
• Measure the infant’s weight and temperature

IF THE INFANT BEEN BROUGHT TO THE FACILITY BECAUSE S/HE IS SICK (INITIAL VISIT):
• URGENTLY ASSESS and CLASSIFY for POSSIBLE SERIOUS BACTERIAL INFECTION (p. 3)
• Then complete the YOUNG INFANT assessment (p. 4 - 10)
• Provide treatment (including pre-referral treatment and referral if required)
• Counsel the caregiver on Home Care for the Young Infant and When to Return (p. 14)
• Assess breastfeeding and support the mother to successfully breastfeed the infant (p. 17 - 18)

IF THIS IS A FOLLOW-UP VISIT:
• Complete the YOUNG INFANT assessment including ASSESS and CLASSIFY for POSSIBLE SERIOUS BACTERIAL INFECTION (p. 3)
• Provide FOLLOW-UP CARE (p. 15)
• Counsel the caregiver on Home Care for the Young Infant and When to Return (p. 14)
• Assess breastfeeding and support the mother to successfully breastfeed the infant (p. 17 - 18)

IF THE YOUNG INFANT HAS BEEN BROUGHT FOR A ROUTINE POST-NATAL OR WELL CHILD VISIT:
• Complete the YOUNG INFANT assessment including ASSESS and CLASSIFY for POSSIBLE SERIOUS BACTERIAL INFECTION (p. 3)
• TREAT (if necessary)
• Counsel the caregiver on Home Care for the Young Infant and When to Return (p.14)
• Assess breastfeeding and support the mother to successfully breastfeed the infant (p. 17 - 18)
### Check for Possible Bacterial Infection and Jaundice

#### Any of these:

- Convulsions with this illness.
- Apnoea or breathing < 30 per minute
- Fast breathing (> 60 per minute), severe chest indrawing, nasal flaring or grunting.
- Bulging fontanelle.
- Fever (37.5°C or above or feels hot) or low body temperature (less than 35.5°C or feels cold).
- Only moves when stimulated.
- Abundant pus/purulent discharge from eyes, or swollen eyelids.
- Umbilical redness extending to the skin and/or draining pus.
- Many or severe skin pustules.

#### Possible Serious Bacterial Infection

- Give diazepam rectally if convulsing at present (p. 35)
- Give oxygen if indicated (p. 11)
- Give first dose of ceftriaxone IM (p. 12)
- If fast breathing, chest indrawing or grunting, give cotrimoxazole 2.5 ml if older than 1 month (p. 38)
- If there is abundant pus or purulent discharge or eyelids are swollen, irrigate with normal saline immediately. Repeat hourly until referral.
- Test for low blood sugar, and treat or pre-vent (p. 11)
- Breastfeed if possible
- Keep the infant warm on the way (p. 11)
- Refer URGENTLY

#### Local Bacterial Infection

- Treat skin pustules and a red umbilicus with cephalexin or flucloxacillin (p. 12)
- Give chloramphenicol eye ointment if sticky or purulent discharge of eyes is present (p. 13)
- If the discharge is purulent, give one dose of Ceftriaxone (p. 12).
- Follow-up after one day (p. 15).
- Teach the caregiver to treat local infections at home (p. 13) and counsel on home care for the young infant (p. 14)
- Follow-up in 2 days (p. 15)

#### No Bacterial Infection

- Counsel the caregiver on home care for the young infant (p. 14)

#### Severe Jaundice

- Test for low blood sugar, and treat or prevent (p. 11)
- Keep the infant warm (p. 11)
- Refer URGENTLY

#### Jaundice

- Advise the caregiver to return immediately if palms and soles appear yellow (p. 15)
- Follow-up in 1 day (p. 15)
- If the young infant is older than 14 days, refer for assessment

#### No Jaundice

- Counsel the caregiver on home care for the young infant (p. 14)
**IMCI PROCESS FOR ALL YOUNG INFANTS** (Birth up to two months)

**DOES THE YOUNG INFANT HAVE DIARRHOEA?**

**ASK**
- For how long?
- Is there blood in the stool?

**LOOK, LISTEN, FEEL**
- Look at the young infant's general condition. Is the infant:
  - Lethargic or unconscious?
  - Restless and irritable?
  - Look for sunken eyes.
  - Pinch the skin of the abdomen. Does it go back:
    - Very slowly (> 2 seconds)?
    - Slowly?

A YOUNG INFANT HAS DIARRHOEA IF THE STOOLS HAVE CHANGED FROM THE UsUAL PATTERN, AND ARE MANY AND WATERY (MORE WATER THAN FAECAL MATTER).

**CLASSIFY DIARRHOEA**

**AND IF DIARRHOEA 14 DAYS OR MORE**
- Diarrhoea lasting 14 days or more

**AND IF BLOOD IN STOOL**
- Blood in the stool.

**Two of the following signs:**
- Lethargic or unconscious.
- Sunked eyes.
- Skin pinch goes back very slowly.
- Young infant less than one month of age.

**START INTRAVENOUS INFUSION** (Plan C, p. 43)
- Give first dose of ceftriaxone IM (p. 12)
- Breastfeed or give frequent sips of ORS if possible
- Keep the infant warm on the way to hospital (p. 11)
- Refer URGENTLY

**SEVERE DEHYDRATION**
- If other severe classification, refer with breastfeeding or ORS sips on the way
- Give fluid for some dehydration Plan B (p. 42)
- Advise mother to continue breastfeeding
- Give zinc for 14 days (p. 41)
- Follow-up in 2 days (p. 15)
- Counsel the caregiver on home care for the young infant (p. 14)

**SOME DEHYDRATION**
- Not enough signs to classify as some or severe dehydration.

**NO VISIBLE DEHYDRATION**
- Give fluids to treat for diarrhoea at Home (Plan A p. 42)
- If exclusively breastfed, do not give other fluids except SSS
- Give zinc for 14 days (p. 41)
- Counsel the caregiver on home care for the young infant (p. 14)
- Follow-up in 2 days (p. 15)

**SEVERE PERSISTENT DIARRHOEA**
- Refer after treating for dehydration if present
- Keep the infant warm on the way to hospital (p. 11)

**SERIOUS ABDOMINAL PROBLEM**
- Refer URGENTLY.
- Keep the infant warm on the way to hospital (p. 11)
**IMCI PROCESS FOR ALL YOUNG INFANTS (Birth up to two months)**

**WAS THE YOUNG INFANT EXAMINED BY A HEALTH WORKER AFTER BIRTH?**

<table>
<thead>
<tr>
<th>ASK</th>
<th>LOOK AND FEEL</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Ask the mother if she has any concerns&lt;br&gt; • Ask for any identified birth defects or other problems&lt;br&gt; • Was the mother’s RPR tested in pregnancy?&lt;br&gt; • If yes, was it positive or negative?&lt;br&gt; • If positive, did she receive treatment?&lt;br&gt; • If yes, how many doses?&lt;br&gt; • How long before delivery did she receive the last dose?</td>
<td>• Measure head circumference,&lt;br&gt; • LOOK FOR PRIORITY SIGNS&lt;br&gt; • Cleft palate or lip&lt;br&gt; • Imperforate anus&lt;br&gt; • Nose not patent&lt;br&gt; • Macrocephaly (birth head circumference more than 39 cm)&lt;br&gt; • Ambiguous Genitalia&lt;br&gt; • Abdominal distention&lt;br&gt; • Very low birth weight (≤ 2kg)</td>
</tr>
</tbody>
</table>

**LOOK FOR OTHER ABNORMAL SIGNS**

- **HEAD AND NECK**
  - Microcephaly (Birth head circumference less than 32 cm)<br>  - Fontanella or sutures abnormal<br>  - Swelling of scalp, abnormal shape<br>  - Neck swelling or webbing<br>  - Face, eyes, mouth or nose abnormal<br>  - Unusual appearance

- **LIMBS AND TRUNK**
  - Abnormal position of limbs<br>  - Club foot<br>  - Abnormal fingers and toes, palms<br>  - Abnormal chest, back and abdomen<br>  - Undescended testis or hernia

**SIGNS OF CONGENITAL SYPHILIS**

- Oedema<br> - Pallor or jaundice<br> - Reduced movements or irregular, jerky movements.<br> - Full fontanelle<br> - Large lymph nodes<br> - Large liver and/ or spleen<br> - Respiratory distress<br> - Small red or purple spots in the skin (petechiae)<br> - Blisters on hands and feet

**CLASSIFY YOUNG INFANT**

**IF NO, ASSESS FOR CONGENITAL PROBLEMS**

**Any one of the PRIORITY SIGNS:**

- Cleft palate or lip<br> - Imperforate anus<br> - Nose not patent<br> - Macrocephaly<br> - Ambiguous Genitalia<br> - Abdominal distention<br> - Very low birth weight (≤ 2kg)

**MAJOR ABNORMALITY OR SERIOUS ILLNESS**

- Give diazepam rectally if convulsing at present (p. 35)<br> - Give oxygen if indicated (p. 11)<br> - Give first dose of ceftriaxone IM (p. 12)<br> - If fast breathing, chest indrawing or grunting, give cotrimoxazole 2.5 ml if older than 1 month (p. 38)<br> - If there is abundant pus or purulent discharge or eyelids are swollen, irrigate with normal saline immediately. Repeat hourly until referral.<br> - Test for low blood sugar, and treat or pre-vent (p. 11)<br> - Breastfeed if possible<br> - Keep the infant warm on the way (p. 11)<br> - Refer URGENTLY

**BIRTH ABNORMALITY**

- One or more abnormal signs

**MAJOR ABNORMALITY OR SERIOUS ILLNESS**

- Keep warm, skin to skin (p. 11)<br> - Assess breastfeeding (p. 20)<br> - Address any feeding problems and support mother to breastfeed successfully (p. 21—20)<br> - Refer for assessment<br> - If not able to breastfeed, give EBM 3ml/kg per hour on the way

**POSSIBLE CONGENITAL SYPHILIS**

- Mother’s RPR positive and she is<br>  - Untreated<br>  - Partially treated (fewer than three doses)<br>  - Treatment completed less than 1 month before delivery<br> - Mother’s RPR is not known, and it is not possible to get the result now

**NO BIRTH ABNORMALITIES**

- No risks nor abnormal signs

**MAJOR ABNORMALITY OR SERIOUS ILLNESS**

- Counsel the caregiver on home care for the young infant (p. 14)
**IMCI PROCESS FOR ALL YOUNG INFANTS** (Birth up to two months)

**THEN CONSIDER**

**RISK FACTORS IN ALL YOUNG INFANTS**

---

**LOOK AT THE CHILD’S ROAD TO HEALTH BOOKLET AND/OR ASK:**

- Has the mother or a close contact had TB or been on TB treatment in the last 6 months? If yes:
  - Did the mother start TB treatment more than 2 months before delivery?
  - Assess the infant for symptoms and signs of congenital TB (box below).
  - How much did the infant weigh at birth?
  - Was the infant admitted to hospital after birth? If so, for how many days?
  - Who is the child’s caregiver?
  - How old is the mother/caregiver?
  - Is the infant exclusively breastfed?

**CHECK FOR SIGNS AND SYMPTOMS OF CONGENITAL TB**

Congenital TB may be asymptomatic. Symptoms suggestive of TB:

- Low birth weight
- Poor feeding
- Poor weight gain
- Fever
- Lethargy/ irritability
- Jaundice
- Fast breathing/ shortness of breath
- Enlarged lymph nodes
- Enlarged liver and/or spleen

---

**CLASSIFY ALL YOUNG INFANT**

<table>
<thead>
<tr>
<th>Possible Congenital TB</th>
<th>Possible TB Exposed Infant</th>
<th>Possible Social Problem</th>
<th>No Risk Factors</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Mother on TB treatment for less than 2 months before delivery AND</strong></td>
<td><strong>Give INH for 6 months if mother has received TB treatment for more than 2 months before delivery</strong></td>
<td><strong>Assess breastfeeding and support mother to breastfeed successfully</strong></td>
<td><strong>Counsel the caregiver on home care for the young infant</strong></td>
</tr>
<tr>
<td><strong>Infant has one or more symptoms/ signs of congenital TB</strong></td>
<td><strong>Give BCG on completion of INH or TB treatment</strong></td>
<td><strong>If not breastfeeding, counsel and explain safe replacement feeding</strong></td>
<td><strong>Counsel the caregiver on home care for the young infant</strong></td>
</tr>
<tr>
<td><strong>Mother on TB treatment for more than 2 months before delivery AND</strong></td>
<td><strong>Consider HIV infection in the infant</strong></td>
<td><strong>Monitor growth and health more frequently</strong></td>
<td><strong>Counsel the caregiver on home care for the young infant</strong></td>
</tr>
<tr>
<td><strong>Infant has no symptoms/ signs of congenital TB</strong></td>
<td><strong>Give BCG on completion of INH or TB treatment</strong></td>
<td><strong>Encourage mother to attend follow-up appointments and refer to other services if indicated</strong></td>
<td><strong>Counsel the caregiver on home care for the young infant</strong></td>
</tr>
<tr>
<td><strong>Mother has died or is ill OR Infant not breastfed OR Teenage caregiver</strong></td>
<td><strong>Monitor growth and health more frequently</strong></td>
<td><strong>Make sure that the birth has been registered and that the child is receiving a child support grant if eligible</strong></td>
<td><strong>Counsel the caregiver on home care for the young infant</strong></td>
</tr>
</tbody>
</table>

---

**POSSIBLE CONGENITAL TB**

- Refer to hospital for investigations. If diagnosed with TB the baby will need a full course of TB treatment (p. 39).
- Give BCG on completion of INH or TB treatment.
- Ask about the caregiver’s health, and treat as necessary (p. 10).
- Provide follow-up (p. 51).

**POSSIBLE TB EXPOSED**

- Give INH for 6 months if mother has received TB treatment for more than 2 months before delivery (p. 38)
- Give BCG on completion of INH or TB treatment
- Consider HIV infection in the infant (p. 7)
- Ask about the caregiver’s health, and treat as necessary (p. 10)
- Provide follow-up (p. 51)

**POSSIBLE SOCIAL PROBLEM**

- Assess breastfeeding and support mother to breastfeed successfully (p. 21 - 23)
- Conduct home visits to assess feeding and growth
- Encourage mother to attend follow-up appointments and refer to other services if indicated (further medical assessment, social worker, support group)
- Make sure that the birth has been registered and that the child is receiving a child support grant if eligible
- Refer to other available services if indicated (social worker, community based organisations)
- No risk factors
- Counsel the caregiver on home care for the young

---

**IMCI PROCESS FOR ALL YOUNG INFANTS** (Birth up to two months)
HAS THE CHILD BEEN TESTED FOR HIV INFECTION?

**If yes, and the result is available, ask:**

- What was the result of the test?
- Was the child breastfeeding when the test was done, or had the child breastfed less than 6 weeks before the test was done?
- Is the child currently taking ARV prophylaxis?

**HIV testing in infants 0 - 2 months:**

- All HIV-exposed infants should have been tested at birth. Ensure you obtain the result.
- If the test was negative, re-test:
  - At 10 weeks of age— all HIV-exposed infants.
  - At 6 months of age— all HIV-exposed infants.
- If the child is ill or has features of HIV infection 6 weeks after stopping breastfeeding.
- Universal HIV rapid test at 18 months for all infants, regardless of HIV exposure.

Below 18 months of age, use an HIV PCR test to determine the child's HIV status. Do not use an antibody test to determine HIV status in this age group. If HIV PCR positive, do a second HIV PCR test to confirm the child's status.

**Classify for HIV status**

<table>
<thead>
<tr>
<th>Infant has positive PCR test</th>
<th>HIV INFECTED</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Follow the six steps for initiation of ART (p. 52)</td>
<td></td>
</tr>
<tr>
<td>- Give cotrimoxazole prophylaxis from 6 weeks (p. 38)</td>
<td></td>
</tr>
<tr>
<td>- Assess feeding and counsel appropriately (p. 16 - 22)</td>
<td></td>
</tr>
<tr>
<td>- Ask about the caregiver’s health, and ensure that she is receiving the necessary care and treatment.</td>

</thead>
</table>
| • How is feeding going?  
 • How many times do you breastfeed in 24 hours?  
 • Does your baby get any other food or drink?  
 • If yes, how often?  
 • What do you use to feed your baby? | • Plot the weight on the RTHB to determine the weight for age.  
 • Look at the shape of the curve. Is the child growing well?  
 • If the child is less than 10 days old:  
 • Has the child lost more than expected body weight?  
 • Has the child regained birth weight at 10 days?  
 • Is the child gaining sufficient weight?  
 • Look for ulcers or white patches in the mouth (thrush). | • Not able to feed. or  
 • Not attached at all. or  
 • Not suckling at all. | • Treat as possible serious bacterial infection (p. 3)  
 • Give first dose of ceftriaxone IM (p. 12).  
 • Test for low blood sugar, and treat or pre-vent (p. 11)  
 • Refer URGENTLY to hospital—make sure that the baby is kept warm (p. 11) | • Not well attached to breast.  
 OR  
 • Not suckling effectively. or  
 • Less than 8 breastfeeds in 24 hours.  
 OR  
 • Infant is taking foods or drinks other than breast-milk  
 OR  
 • Thrush | • Advise the mother to breastfeed as often and for as long as the infant wants, day and night  
 • If not well attached or not suckling effectively, teach correct positioning and attachment (p. 17)  
 • If breastfeeding less than 8 times in 24 hours, advise to increase frequency of feeding  
 • If mother has a breastfeeding problem see advice for common breastfeeding problems (p. 17 - 18,22)  
 • If receiving other foods or drinks, counsel mother on exclusive breastfeeding, and the importance of stopping other foods or drinks P. 17 - 18,22)  
 • If thrush, treat and teach the mother to treat for thrush at home (p. 13)  
 • Follow-up in 2 days (p. 15) | • More than 10% weight loss in the first week of life.  
 OR  
 • Weight less than birth weight at or after 2 week visit.  
 OR  
 • Low weight for age. or  
 • Weight gain is unsatisfactory.  
 OR  
 • Weight loss following discharge of LBW infant | • Advise the mother to breastfeed as often and for as long as the infant wants, day and night  
 • If less than 2 weeks old follow-up in 2 days (p. 15)  
 • If more than 2 weeks old follow-up in 7 days (p. 15) | • Not low weight for age and no other signs of inadequate feeding.  
 • Less than 10% weight loss in the first week of life | • Praise the mother for feeding the infant well  
 • Counsel the caregiver on home care for the young infant (p. 14) |

**IF THE BABY:**
• Has any difficulty feeding, or
• Is breastfeeding less than 8 times in 24 hours, or
• Is taking any other foods or drinks, or
• Is low weight for age, or
• Is not gaining weight

**AND**
• Has no indications to refer urgently to hospital:

**THEN ASSESS BREASTFEEDING:**
• Has the baby breastfed in the previous hour?
• If baby has not fed in the last hour, ask mother to put baby to the breast. Observe the breastfeed for 4 minutes. (If baby was fed during the last hour, ask mother if she can wait and tell you when the infant is willing to feed again).
• Is baby able to attach?

- not at all
- poor attachment
- good attachment
• Is the baby suckling well (that is, slow deep sucks, sometimes pausing)?
• not at all
• not suckling well

**NOTE:**
• Young infants may lose up to 10% of their birth weight in the first few days after birth, but should regain their birth weight by ten days of age
• Thereafter minimum weight gain should be: Preterm: 10g/kg/day or Term: 20g/kg/day

10% OF BIRTH WEIGHT = BIRTH WEIGHT divided by 10

*IMCI PROCESS FOR ALL YOUNG INFANTS* (Birth up to two months)
**IMCI PROCESS FOR ALL YOUNG INFANTS** (Birth up to two months)

**THEN CHECK FOR FEEDING AND GROWTH**

(Alternative chart for non-Breastfed infants)

</tbody>
</table>

**IMCI PROCESS FOR ALL YOUNG INFANTS** (Birth up to two months)

**NOT ABLE TO FEED**

- Treat as possible serious bacterial infection (p. 3)
- Give first dose of ceftriaxone IM (p. 12). Test for low blood sugar, and treat or prevent (p. 11)
- Refer URGENTLY —make sure that the baby is kept warm

**FEEDING PROBLEM**

- Counsel about feeding and explain the guidelines for safe replacement feeding (p. 19 - 20)
- Identify concerns of caregiver and family about feeding
- If caregiver is using a bottle, teach cup feeding (p. 18)
- If thrush, treat and teach the caregiver to treat it at home (p. 13)
- Follow-up in 2 days (p. 15)

**POOR GROWTH**

- Check for feeding problem (p. 21)
- Counsel about feeding (p. 19 - 20)
- If less than 2 weeks old follow-up in 2 days (p. 15)
- If more than 2 weeks old follow-up in 7 days (p. 15)

**FEEDING AND GROWING WELL**

- Counsel the caregiver on home care for the young infant emphasising the need for good hygiene (p. 14)
- Praise the caregiver
THEN CHECK THE YOUNG INFANT’S IMMUNISATION STATUS AND IMMUNISE IF NEEDED

IMMUNISATION SCHEDULE:

<table>
<thead>
<tr>
<th>BIRTH</th>
<th>BCG</th>
<th>OPV0</th>
<th>BCG</th>
</tr>
</thead>
<tbody>
<tr>
<td>6 weeks</td>
<td>Hexavalent1 (DaPT-IPV-HB-Hib1)</td>
<td>OPV1</td>
<td>PCV1</td>
</tr>
<tr>
<td>10 weeks</td>
<td>Hexavalent2 (DaPT-IPV-HB-Hib2)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- Give all missed doses on this visit
- Preterm infants should be immunised at six and ten weeks: do not delay their immunisations. If they received OPV0 less than four weeks before they reached six weeks of age, give all the other immunisations as usual (OPV1 can be given four weeks after OPV0 or with the ten week doses)
- Include sick babies and those without a RTHB
- If the child has no RTHB, issue a new one today
- Advise the caregiver when to return for the next immunisation
- Refer to the EPI Vaccinator’s Manual for more information

ASSESS THE CAREGIVER’S HEALTH

- Check for maternal danger signs and refer urgently if present.
- Check that mother has received post-natal care according to Maternity Guidelines.
- Check for anaemia and breast problems.
- Ask mother about contraceptive usage, and counsel/offer family planning.
- Check HIV status and assess for ART if eligible.
- If already on ART, ask about the mother’s last VL.
- Screen for TB and manage appropriately.
- Check RPR results and complete treatment if positive.
- Ask about any other problems.

MATERNAL DANGER SIGNS

- Excessive vaginal bleeding
- Foul smelling vaginal discharge
- Severe abdominal pain
- Fever
- Excessive tiredness or breathlessness
- Swelling of the hands and face
- Severe headache or blurred vision
- Convulsion or impaired consciousness

ASSESS AND MANAGE OTHER PROBLEMS
## Treat the Young Infant

**Explain to the caregiver why the treatment is being given**

### Prevent Low Blood Sugar in Young Infant (hypoglycaemia)

- **If the child is able to swallow:**
  - If breastfed: ask the mother to breastfeed the child
  - If the baby is too sick to feed, give 3ml/kg per hour of expressed breastmilk
  - on the way to hospital
  - If baby has severe lethargy and cannot swallow, give the milk by nasogastric tube

- **If feeding is contraindicated:**
  - Put up intravenous (IV) line and give 10% glucose by slow IV infusion at 3ml/kg/hour (3 drops per kg/hour)
  - Use a dial-a-flow to monitor the flow rate
  - Example: If the baby weighs 4 kg then give 12 ml/hour

### Give Oxygen

- Give oxygen to all young infants with:
  - Convulsions
  - Apnoea or breathing < 30 minute
  - Fast breathing, severe chest indrawing, nasal flaring or grunting
- **Nasal prongs**
  - Place the prongs just below the baby's nostrils. Use 1mm prongs for small babies and 2mm prongs for term babies
  - Secure the prongs with tape
  - Oxygen should flow at one litre per minute

- **Nasal cannula**
  - This method delivers a higher concentration of oxygen
  - Insert a FG5 or FG6 nasogastric tube 2 cm into the nostril.
  - Secure with tape
  - Turn on oxygen to flow of half a litre per minute

### Treat for low blood sugar (hypoglycaemia)

- **Suspect low blood sugar in any infant or child that:**
  - is convulsing, unconscious or lethargic; OR
  - has a temperature below 35°C.
  - Confirm low blood sugar using blood glucose testing strips.
  - Keep the baby warm at all times.

- **Low blood sugar 1.4 to less than < 2.5 mmol/L in a young infant**
  - Breastfeed or feed expressed breastmilk.
  - If breastfeeding is not possible give 10mg/kg of replacement milk feed
  - Repeat the blood glucose in 15 minutes while awaiting transport to hospital
  - If the blood sugar remains low, treat for severe hypoglycaemia (see below)
  - If the blood glucose is normal, give milk feeds and check the blood glucose 2-3 hourly

- **Low blood sugar < 1.4 mmol/L in a young infant**
  - Give a bolus of 10% dextrose infusion (Neonatalyte) at 2ml/kg
  - Then continue with the 10% dextrose infusion at 3ml/kg/hour
  - Repeat the blood glucose in 15 minutes.
  - If still low repeat the bolus of 2ml/kg and continue IV infusion
  - Refer URGENTLY and continue feeds during transfer
  - If neonatalyte not available add 1 part 50% dextrose water to 4 parts water to make 10% solution

### Keep the infant or child warm

- Use Skin-to-skin to keep the baby warm, unless the mother is too ill, or if the baby is too ill and requires observation. (If this is the case, then nurse the infant in a transport incubator or wrap in blankets.)
- **Skin-to-skin**
  - Dress the baby with a cap, booties and nappy
  - Place the baby skin to skin between the mother's breasts
  - Cover the baby
  - Secure the baby to the mother
  - Cover both mother and baby with a blanket or jacket if the room is cold

---

IMCI PROCESS FOR ALL YOUNG INFANTS  (Birth up to two months)
**TREAT THE YOUNG INFANT**

---

**Treat for POSSIBLE SERIOUS BACTERIAL INFECTION with Intramuscular Ceftriaxone**

- Give first dose of ceftriaxone IM.
- The dose of ceftriaxone is 50 mg per kilogram.
- Also give one dose of ceftriaxone if the infant has LOCAL BACTERIAL INFECTION with a purulent discharge of eyes.

**CEFTRIAXONE INJECTION**

Give a single dose in the clinic

<table>
<thead>
<tr>
<th>WEIGHT</th>
<th>CEFTRIAXONE (250 mg in 1 ml)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 - &lt; 3 kg</td>
<td>0.5 ml</td>
</tr>
<tr>
<td>3 - 6 kg</td>
<td>1 ml</td>
</tr>
</tbody>
</table>

---

**Give Intramuscular Penicillin for POSSIBLE CONGENITAL SYPHILIS**

Give once only

- Give Benzathine Benzylpenicillin IM (injection) 50 000 units / kg into the lateral thigh.
- Dilute 1.2 million units with 4 ml of sterile water to give in the clinic.
- Refer all babies if the mother is RPR positive and the baby presents with Low birth Weight OR Blisters on hands and feet OR Pallor OR petechiae OR hepatosplenomegaly OR if you are unsure

---

**TREAT SKIN PUSTULES OR RED UMBILICUS with Cephalexin or Flucloxacillin**

- Give cephalexin OR flucloxicillin for 7 days
- If child has penicillin allergy, refer.

**CEPHALEXIN OR FLUCLOXICILLIN**

Give four times a day for seven days

<table>
<thead>
<tr>
<th>WEIGHT</th>
<th>Cephalexin syrup 125 mg in 5 ml</th>
<th>Flucloxacillin syrup 125 mg in 5 ml</th>
</tr>
</thead>

---

**Give ARV Prophylaxis**

**Risk category**

- **LOW RISK** (at birth)
  - Newborn infant of mother on ART with a VL result of <1000 copies/ml at delivery

- **HIGH RISK** (at birth)
  - At birth:
    - Mother on ART with a VL of >1000 copies/ml at delivery or no HIV VL available at birth/within the last 12 weeks before birth.
    - Mother not on ART at delivery.

- **HIGH RISK** (during breastfeeding)
  - During breastfeeding:
    - Mother on ART with latest VL of >1000 copies/ml.
    - Mother not on ART.

- **HIGH RISK** (exclusive formula feeding)
  - Exclusively formula fed infant of:
    - Mother not on ART at delivery.
    - Mother on ART with VL >1000 copies/ml at delivery or no HIV VL at birth/with the last 12 weeks before birth.

**Scenario**

- Nevirapine for 6 weeks.
- Nevirapine for at least 12 weeks, until mother’s VL is <1000 copies/ml or until 1 week after cessation of all breastfeeding.
- Zidovudine for 6 weeks.

**Infant ART prophylaxis**

- If at any stage the infant’s PCR test is positive, stop prophylaxis and initiate ART according to the six steps p 52.
- Obtain expert advice on dosing of NVP and AZT for:
  - Premature infants <35 weeks gestation and <2.0 kg.
  - Infants underweight for age (with WFA z-score < -3).

**AGE/WEIGHT**

- **NEVIRAPINE (NVP) SOLUTION (10mg/ml) Once daily**
  - Birth to 6 weeks
    - Weight 2.0 - < 2.5 kg
      - 1 ml (10mg) daily
    - Weight 2.5 kg or more
      - 1.5 ml (15mg) daily
  - 6 weeks up to 6 months
    - 2 ml (20mg) daily
  - 6 months up to 9 months
    - 3 ml (30mg) daily
  - 9 months until 1 week after breast-feeding stops
    - 4 ml (40mg) daily

- **ZIDOVUDINE (AZT) SOLUTION (10mg/ml) Twice daily**
  - Birth to 6 weeks
    - Weight 2.0 - < 2.5 kg
      - 1 ml (10 mg) twice daily
    - Weight 2.5 kg
      - 1.5 ml (15 mg) twice daily
  - > 6 weeks
    - Weight 3.0 - < 6 kg
      - 6 ml (60 mg) twice daily
    - Weight 6 - 8 kg
      - 9 ml (90 mg) twice daily

**AGE/WEIGHT**

- **BENZATHINE BENZYLPENICILLIN INJECTION 300 000 units in 1 ml**

<table>
<thead>
<tr>
<th>WEIGHT</th>
<th>BENZATHINE BENZYLPENICILLIN INJECTION 300 000 units in 1 ml</th>

</tbody>
</table>
TREAT THE YOUNG INFANT

Treat for Diarrhoea (p. 42- 43)

- If there is DIARRHOEA WITH SEVERE DEHYDRATION or DIARRHOEA WITH SOME DEHYDRATION (p.42 – 43)
- Explain how the treatment is given
- If there is SEVERE DEHYDRATION commence intravenous rehydration, give the first dose of ceftriaxone IM (p. 12) and REFER URGENTLY.

Teach the Caregiver to treat Local Infections at home

- Explain how the treatment is given.
- Watch her as she does the first treatment in the clinic.
- She should return to the clinic if the infection worsens.

Treat for Thrush with Nystatin

If there are thick plaques the caregiver should:
- Wash her hands with soap and water.
- Wet a clean soft cloth with chlorhexidine 0.2% or salt water, wrap this around the little finger, then gently wipe away the plaques.
- Wash hands again.

For all infants with thrush
- Give nystatin 1 ml after feeds for 7 days.
- If breastfed, check mother’s breasts for thrush. If present treat mother’s breasts with nystatin.
- Advise mother to wash nipples and areolae after feeds.
- If bottle fed, change to cup and make sure that caregiver knows how to clean utensils used to prepare and administer the milk (p. 23 - 25).

Treat for Skin Pustules or Umbilical Infection

The caregiver should:
- Wash hands with soap and water.
- Gently wash off pus and crusts with soap and water.
- Dry the area.
- Apply povidone iodine cream (5%) or ointment (10%) three times daily.
- Wash hands again.
- Give cephalaxin or flucloxacillin (p. 12) for 7 days.

Treat for purulent or sticky discharge of eyes

The caregiver should:
- Wash hands with soap and water
- Gently wash off discharge and clean the eye with saline or cooled boiled water at least 4 times a day. Continue until the discharge disappears.
- Apply chloramphenicol ointment 4 times a day for seven days.
- Wash hands again after washing the eye.
Counsel the mother or caregiver on home care for the young infant

1. Fluids and Feeding
   - Ensure good communication with the mother to promote early and exclusive breastfeeding (p. 17—18)
   - Counsel the mother to breastfeed frequently, as often and for as long as the infant wants, day or night, during sickness and health (p. 18 - 20)

2. Make sure that the young infant is kept warm at all times
   - Encourage mother to keep infant warm using skin-top-skin contact (p. 11)
   - In cool weather, cover the infant’s head and feet and dress the infant with extra clothing.

3. Maintain a hygienic environment
   - Advise the caregiver to wash her hands with soap and water after going to the toilet, changing the infant’s nappy and before each feed.

4. Support the family to care for the infant
   - Help the mother, family and caregiver to ensure the young infant’s needs are met.
   - Assess any needs of the family and provide or refer for management.

5. When to return

### Follow-up visits

### When to return immediately:

Advised caregiver to return immediately if the young infant has any of these signs:

- Breastfeeding poorly or drinking poorly.
- Irritable or lethargic.
- Vomits everything.
- Convulsions.
- Fast breathing.
- Difficult breathing.
- Blood in stool.
## IMCI PROCESS FOR ALL YOUNG INFANTS

### Local Bacterial Infection

**After 1 or 2 days:**
- Discharge of eyes: has the discharge improved? Are the lids swollen?
- Red umbilicus: Is it red or draining pus? Does redness extend to the skin?
- Skin pustules: Are there many or severe pustules?

**Treatment:**
- If condition remains the same or is worse, refer.
- If condition is improved, tell the caregiver to continue giving the antibiotic and continue treating for the local infection at home (p. 13).

### Feeding Problem

**After 2 days:**
- Ask about any feeding problems found on the initial visit and reassess feeding (p. 8 or 9).
- Counsel the caregiver about any new or continuing feeding problems. If you counsel the caregiver to make significant changes in feeding, ask her to bring the young infant back again after 5 days.
- If the young infant has POOR GROWTH (low weight for age or has poor weight gain), ask the caregiver to return again after 5 days to measure the young infant’s weight gain. Continue follow-up until the weight gain is satisfactory.
- If the young infant has lost weight, refer.

**Exception:**
- If the young infant has lost weight or you do not think that feeding will improve, refer.

### Jaundice

**After 1 day:**
- Look for jaundice (yellow eyes or skin)
- Look at the young infant’s palms and soles. Are they yellow?
- Reassess feeding
- If palms and soles yellow, refer
- If palms and soles not yellow and infant feeding well, counsel mother to continue breastfeeding and to provide home care.
- If you are concerned about the jaundice, ask the mother to return after one or two days or if the jaundice becomes worse.

### Poor Growth

**After 2 days in infant less than 2 weeks or 7 days in infant more than 2 weeks:**
- Reassess feeding (p. 8 or 9).
- Check for possible serious bacterial infection and treat if present (p. 3).
- Weigh the young infant. Determine weight gain.
- If the infant is no longer low weight for age, praise the caregiver and encourage her to continue.
- If the infant is still low weight for age, but is gaining weight, praise the caregiver. Ask her to have her infant weighed again within 14 days or when she returns for immunisation, whichever is the earlier.

**Exception:**
- If you do not think that feeding will improve, or if the young infant has lost weight, refer.

### Thrush

**After 2 days in infant less than 2 weeks or 7 days in infant more than 2 weeks:**
- Look for thrush in the mouth.
- Reassess feeding (p. 8 or 9).

**Treatment:**
- If thrush is worse check that treatment is being given correctly, and that the mother has been treated for thrush, if she is breastfeeding. Also consider HIV INFECTION (p. 7).
- If the infant has problems with attachment or feeding, refer.
- If thrush is the same or better, and the baby is feeding well, continue with nystatin for a total of 7 days.
COUNSEL THE MOTHER OR CAREGIVER ON INFANT AND YOUNG CHILD FEEDING

COMMUNICATION SKILLS

• Be respectful and understanding
• Listen to the family’s concerns and encourage them to ask questions and express their emotions
• Use simple and clear language
• Ensure that the family understands any instructions and give them written information
• If a baby needs to be referred, explain the reason for the referral and how the baby will be referred.
• Respect the family’s right to privacy and confidentiality
• Respect the family’s cultural beliefs and customs, and accommodate the family’s needs as much as possible
• Remember that health care providers may feel anger, guilt, sorrow, pain and frustration
• Obtain informed consent before doing any procedures

Listening and Learning skills

• Use helpful non-verbal behaviour.
• Ask open-ended questions.
• Use responses and gestures that show interest.
• Reflect back what the caregiver says.
• Avoid judging words.

Confidence Building skills

• Accept what the caregiver says, how she thinks and feels.
• Recognise and praise what the caregiver is doing right.
• Give practical help.
• Give relevant information according to the caregiver’s needs and check her understanding.
• Use simple language.
• Make suggestions rather than giving commands.
• Reach an agreement with the caregiver about the way forward.
SUPPORT MOTHERS TO BREASTFEED SUCCESSFULLY

**BREASTFEEDING ASSESSMENT**

- Has the baby breastfed in the previous hour?
- If baby has not fed in the last hour, ask mother to put baby to the breast. Observe the breastfeed for 4 minutes. (If baby was fed during the last hour, ask mother if she can wait and tell you when the infant is willing to feed again).
- Is baby able to attach?
  - not at all poor attachment good attachment
- Is the baby suckling well (that is, slow deep sucks, sometimes pausing)?
  - not at all not suckling well suckling well
- Clear a blocked nose if it interferes with breastfeeding

**Signs of good attachment**

- More areola visible above than below baby’s mouth
- Mouth wide open
- Lower lip turned outwards
- Chin touching breast
- Slow, deep sucks and swallowing sounds

**TEACH CORRECT POSITIONING AND ATTACHMENT**

- Seat the mother comfortably
- Show the mother how to hold her infant:
  - with the infant’s head and body straight
  - facing her breast, with infant’s nose opposite her nipple
  - with infant’s body close to her body
  - supporting infant’s whole body, not just neck and shoulders.
- Show her how to help the infant attach. She should:
  - touch her infant’s lips with her nipple.
  - wait until her infant’s mouth is opening wide.
  - move her infant quickly onto her breast, aiming the infant’s lower lip well below the nipple.
- Look for signs of good attachment and effective suckling. If the attachment or suckling is not good, try again.
- Most of the common breastfeeding problems expressed by mother are related to poor positioning and attachment.

**Signs of poor attachment**

- Baby sucking on the nipple, not the areola
- Rapid shallow sucks
- Smacking or clicking sounds
- Cheeks drawn in
- Chin not touching breast

**TIPS TO HELP A MOTHER BREASTFEED HER BABY**

- Express a few drops of milk on the baby’s lip to help the baby start breastfeeding.
- For low birth weight baby give short rests during a breastfeed;
- If the baby coughs, gags, or spits up when starting to breastfeed, the milk may be letting down too fast for the baby. Teach the mother to take the baby off the breast if this happens.
- Hold the baby against her chest until the baby can breathe well again then put it back to the breast after the let-down of milk has passed.
- If the mother will be away from the baby for some time, teach the mother to express breastmilk (p. 18).
- Make sure that the person who will feed the baby has been taught to cupfeed correctly (p. 18).
EXPRESSING BREASTMILK

- Wash hands with soap and water
- Make sure mother is sitting comfortably – a little forward
- Show her how to cup the breast just behind her areola
- Squeeze the breast gently, using thumb and the rest of fingers in a C shape. This shouldn’t hurt (don’t squeeze the nipple directly as you’ll make it sore and difficult to express).
- Release the pressure then repeat, building up a rhythm. Try not to slide the fingers over the skin. At first, only drops will appear, but if she keeps going this will help build up her milk supply. With practice and a little time, milk may flow freely.
- When no more drops come out, let her move her fingers round and try a different section of the breast.
- When the flow slows down, swap to the other breast. Keep changing breasts until the milk drips very slowly or stops altogether.
- If the milk doesn’t flow, let her try moving her fingers slightly towards the nipple or further away, or give the breast a gentle massage.
- Hold a clean (boiled) cup or container below the breast to catch the milk as it flows.

STORING AND USING EXPRESSED BREASTMILK

- Fresh breastmilk has the highest quality.
- If breastmilk must be stored, advise the mother and family to:
  - Use either a glass or hard plastic container with a large opening and a tight lid to store the breastmilk.
  - Boil the container and lid for 10 minutes before use.
  - If the mother is literate, teach her to write the time and date the milk was expressed (or morning, afternoon, evening) on the container before storing.
  - Defrost frozen breastmilk in a fridge or at room temperature over 12 hours or by letting the container with frozen breastmilk stand in cold water to defrost.
- Make sure that the person who will feed the baby has been taught to cupfeed correctly (see next box).

CUP FEEDING (FOR GIVING EXPRESSED BREASTMILK OR REPLACEMENT FEEDS)

- Hold the baby sitting upright or semi-upright on your lap
- Hold a small cup of milk to the baby’s mouth.
- Tip the cup so that the milk just reaches the baby’s lips.
- The cup rests lightly on the baby’s lower lip and the edge of the cup touches the outer part of the baby’s upper lip.
- The baby will become alert
- Do not pour milk into the baby’s mouth.
- A low birth weight baby starts to take milk with the tongue.
- A bigger / older baby sucks the milk, spilling some of it.
- When finished the baby closes the mouth and will not take any more.
- If the baby has not had the required amount, wait and then offer the cup again, or offer more frequent feeds.
- Give volumes as per guideline (20).
COUNSEL THE MOTHER OR CAREGIVER ABOUT GIVING REPLACEMENT FEEDS

BENEFITS OF BREASTFEEDING

- Breastfeeding is the perfect food for the baby. It contains many antibodies and substances that fight infection, mature the gut and body, and promote optimal growth, development and health for the baby.
- The risk of not breastfeeding is a much higher chance of the baby becoming ill with, or even dying from, diarrhoea, pneumonia or malnutrition.
- If the mother is HIV positive, with ART prophylaxis the risk of HIV transmission is much less than in the past.

REQUIREMENTS FOR SAFE REPLACEMENT FEEDING

- The mother or caregiver must purchase all the formula herself, and be prepared to do this for 12 months.
- Disclosure of her HIV status to relevant family will make it easier as she must give formula only and no breast milk.
- She must safely prepare milk before EACH of 6 – 8 feeds a day.
- Running water in the house and electricity and a kettle are advisable for safe preparation of 6 – 8 feeds a day.
- She must be able to clean and sterilise the equipment after each feed.
- She should use a cup to feed the baby as it is safer than a bottle (p. 23).

REPLACEMENT FEEDS

- Ensure that the mother understands the benefits of breastfeeding and risks of not breastfeeding.
- If the mother (or caregiver) nevertheless chooses not to breastfeed, ensure that she understands the requirements for safe replacement feeding and knows how to prepare replacements feeds safely.
- Infants who are on replacement feeds should receive no other foods or drinks until six months of age.
- Young infants require to be fed at least 8 times in 24 hours.
- Prepare correct strength and amount of replacement feeds before use. (p. 20).
- Cup feeding is safer than bottle feeding. Use a cup which can be kept clean i.e. not one with a spout (p.18).
- Pasteurised full cream milk may be introduced to the non-breastfed infant’s diet from 12 months of age.
- Avoid coffee, tea, creamers and condensed milk.
- Where infant formula is not available, children over six months may temporarily receive undiluted pasteurised full cream milk (boiled), provided that iron supplements or iron-fortified foods are con-sumed and the amount of fluid in the overall diet is adequate.

SAFE PREPARATION OF REPLACEMENT FEEDS

- Wash your hands with soap and water before preparing a feed.
- Boil the water. If you are boiling the water in a pot, it must boil for three minutes. Cover the pot with the lid while the water cools down. If using an automatic kettle, lift the lid of the kettle and let it boil for three minutes.
- The water must still be hot when you mix the feed to kill germs that might be in the pow-der.
- Carefully pour the amount of water that will be needed in the marked cup. Check if the water level is correct before adding the powder. Measure the powder according to the instructions on the tin using the scoop provided. Only use the scoop that was supplied with the formula.
- Mix by stirring with a clean spoon.
- Cool the feed to body temperature under a running tap or in a container with cold water. Pour the mixed formula into a cup to feed the baby.
- Only make enough formula for one feed at a time.
- Feed the baby using a cup (p. 18) and discard any leftover milk within two hours.

Cleaning of equipment used for preparation and giving of feeds.

- If the infant is being cup fed:
  - Wash all containers and utensils used for feeding and preparation thoroughly in hot soapy water. Make sure that all remaining feed is removed. Rinse with clean water, allow to dry or dry with a clean cloth and store in a clean place.
  - If possible, all containers and utensils should be sterilized once a day as described below.
- If the caregiver is using bottles to feed the infant:
  - Wash all containers and utensils used for feeding and preparation thoroughly in hot soapy water. Make sure that all remaining feed is removed using a bottle brush. Rinse with clean water.
  - The bottles and other equipment must be sterilised after each use as described below.
- Sterilization should be done as follows:
  - fill a large pot with water and completely submerge all washed feeding and preparation equipment, ensuring there are no trapped air bubbles
  - cover the pot with a lid and bring to a rolling boil, making sure the pot does not boil dry
  - keep the pot covered until the feeding and preparation equipment is needed.
COUNSEL THE CAREGIVER

NOTE: For formula feeding preparations, advise the caregiver to always use the correct amount of water and formula according to the product instructions. Over-dilution may lead to undernutrition and under-dilution may lead to overweight and cause constipation.

WHEN TO GIVE RUTF (CHILD MUST BE 6 MONTHS OLD OR ABOVE)

- RUTF is for children with severe acute malnutrition (SAM). It should not be shared with other household members.
- Not all children with moderate acute malnutrition should receive RUTF/RUSF.
- However, it may be provided in the following situations:
  - In areas with a high prevalence (new and old cases) of moderate acute malnutrition.
  - To children from food-insecure households.
  - For this group of children special attention to nutrition counselling, interventions to address food security and follow-up care to assess response is crucial.
- The provision of RUTF for children who are stunted is not recommended.

HOW MUCH TO GIVE RUTF (REFER TO PAGE 41)

Sick children often do not like to eat. Give small regular portions of RUTF and encourage the child to eat food often, every 3-4 hours (up to 8 meals per day).

HOW TO GIVE RUTF

- Give amounts according to the guidelines (p. 41).
- Offer plenty of clean water to drink with RUTF.
- Wash the child’s hands and face with soap and water before feeding.
- Keep food clean and covered.

HOW TO DO THE APPETITE TEST? (CHILD MUST BE 6 MONTHS OLD OR ABOVE)

- The appetite test should be conducted in a separate quiet area.
- Explain to the caregiver the purpose of the appetite test and how it will be carried out.
- The caregiver should wash her hands.
- The caregiver should sit comfortably with the child on her/his lap and either offer the RUTF from the packet or put a small amount on her/his finger and give it to the child.
- The caregiver should offer the child the RUTF gently, encouraging the child all the time. If the child refuses then the caregiver should continue to quietly encourage the child and take time over the test.
- The test usually takes a short time but may take up to one hour.
- The child must not be forced to take the RUTF.
- The child needs to be offered plenty of water to drink from a cup as he/she is taking the RUTF.

The result of the appetite test

PASS:
- A child who takes at least the amount shown in the table passes the appetite test.

FAIL:
- A child who does not take at least the amount of RUTF shown in the table should be referred for inpatient care.
- If the appetite is good during the appetite test and the rate of weight gain at home is poor then a home visit should be arranged.
- The MINIMUM amount of RUTF sachets that should be taken is shown in the table.

FEEDING ASSESSMENT

ASSESS THE CHILD’S FEEDING IF THE CHILD IS:

Classified as having:
- MODERATE SEVERE MALNUTRITION
- NOT GROWING WELL
- ANAEMIA
- under 2 years of age

Ask questions about the child’s usual feeding and feeding during this illness. Compare the mother/caregiver’s answers to the Feeding Recommendations for the child’s age (p. 17-23).

ASK:

- How are you feeding your child?
  - Are you breastfeeding?
    - How many times during the day?
    - Do you also breastfeed at night?
  - Are you giving any other milk?
    - What type of milk is it?
    - What do you use to give the milk?
    - How many times in 24 hours?
    - How much milk each time?
    - How is the milk prepared?
    - How are you cleaning the utensils?
  - What other food or fluids are you giving the child?
    - How often do you feed him/her?
    - What do you use to give other fluids?
  - How has the feeding changed during this illness?
  - If the child is not growing well, ASK:
    - How large are the servings?
    - Does the child receive his/her own serving?
    - Who feeds the child and how?

RECOMMENDED PHYSICAL ACTIVITY BABIES

(BIRTH TO 1 YEAR OLD)

Moving
- Being physically active several times a day in a variety of ways through interactive floor-based play, including crawling. For babies not yet mobile, this includes at least 30 minutes of tummy time spread throughout the day while awake, and other movements such as reaching and grasping.

Sitting
- Engaging in stimulating activities with a caregiver, such as playing with safe objects and toys, having baby conversations, singing, and storytelling. Babies should NOT be strapped in and unable to move for more than 1 hour at a time (e.g., in a pram, high chair, or on a caregiver’s back or chest) while awake. Screen time is NOT recommended.

TODDLERS (1 AND 2 YEARS OLD)

Moving
- At least 180 minutes spent in a variety of physical activities including energetic play, spread throughout the day; more is better.

Sitting
- Engaging in activities that promote development such as reading, singing, games with blocks, puzzles, and storytelling with a caregiver. Toddlers should NOT be strapped in and unable to move for more than 1 hour at a time (e.g., in a pram, high chair or strapped on a caregiver’s back or chest), and should not sit for extended periods. For toddlers younger than 2 years, screen time is NOT recommended. For toddlers aged 2 years, screen time should be no more than 1 hour; less is better.

PRE-SCHOOLERS (3, 4 AND 5 YEARS OLD)

Moving
- At least 180 minutes spent in a variety of physical activities, of which at least 60 minutes is energetic play that raises their heart rate and makes them ‘huff and puff’ (e.g. running, jumping, dancing), spread throughout the day; more is better.

Sitting
- Engaging in activities such as reading, singing, puzzles, arts and crafts, and story-telling with a caregiver and other children. Pre-schoolers should NOT be strapped in and unable to move for more than 1 hour at a time and should not sit for extended periods. Screen time should be no more than 1 hour per day; less is better.
COUNSEL THE CAREGIVER ABOUT FEEDING PROBLEMS

If the child is not being fed according to the Feeding Recommendations (p. 17) counsel the caregiver accordingly. In addition:

If the child above 6 months has a poor appetite, or is not feeding well during this illness, counsel the caregiver to:

- Breastfeed more frequently and for longer if possible.
- Use soft, varied, favourite foods to encourage the child to eat as much as possible.
- Give foods of a suitable consistency, not too thick or dry.
- Avoid buying sweets, chips and other snacks that replace healthy food.
- Offer small, frequent feeds. Try when the child is alert and happy, and give more food if he/she shows interest.
- Clear a blocked nose if it interferes with feeding.
- Offer soft foods that don’t burn the mouth, if the child has mouth ulcers / sores e.g. eggs, mashed potatoes, sweet potatoes, pumpkin or avocado.
- Ensure that the spoon is the right size, food is within reach, child is actively fed, e.g. sits on caregiver’s lap while eating.
- Expect the appetite to improve as the child gets better.

If there is no food available in the house:

- Help caregiver to get a Child Support Grant for any of her children who are eligible.
- Put her in touch with a Social Worker and local organisations that may assist.
- Encourage the caregiver to have or participate in a vegetable garden.
- Supply milk and enriched (energy dense) porridge from the Food Supplementation programme.
- Give caregiver appropriate local recipes for enriched (energy dense) porridge.

COUNSEL THE CAREGIVER OF CHILDREN WHO ARE OVERWEIGHT / OBESE:

- Avoid giving your child unhealthy foods like chips, sweets, sugar, and fizzy drinks.
- Give appropriate amount of food and milk (p 20,23.)
- Encourage on physical activity (p 21).

If the child reports difficulty with breastfeeding, assess breastfeeding (p. 8 or 20):

- Identify the reason for the mother’s concern and manage any breast condition.
- If needed, show recommended positioning and attachment (p. 17).
- Build the mother’s confidence.
- Advise her that frequent feeds improve lactation.

If the child is less than 6 months old, and:

- the child is taking foods or fluids other than breastmilk:
  - Build mother’s confidence that she can produce all the breastmilk that the child needs. Water and other milk are not necessary.
  - If she has stopped breastfeeding, refer her to a breastfeeding counsellor to help with relactation.
  - Suggest giving more frequent, longer breastfeeds, day or night, and gradually reducing other milk or foods.
- the mother or infant are not able to breastfeed due to medical reasons, counsel the mother to:
  - Make sure she uses an appropriate infant formula
  - Prepare formula correctly and hygienically, and give adequate amounts (p. 18-20).
  - Discard any feed that remains after two hours.

If the caregiver is using a bottle to feed the child:

- Recommend a cup instead of a bottle. Show the caregiver how to feed the child with a cup (p. 18).

If the child is not being fed actively, counsel the caregiver to:

- Sit with the child and encourage eating.
- Give the child an adequate serving in a separate plate or bowl.
### FEEDING RECOMMENDATIONS FROM 6 MONTHS

<table>
<thead>
<tr>
<th>Your child’s age</th>
<th>What foods to give</th>
<th>How much?</th>
</tr>
</thead>
<tbody>
<tr>
<td>6 – 8 months</td>
<td>Continue breastfeeding on demand. Breastfeed first, then give other foods. Your baby needs iron-rich foods (dried beans, egg, minced meat, boneless fish, chicken or chicken livers, ground mopane worms). These foods must be cooked and mashed to make them soft and easy for your baby to swallow. Also, give your baby:  - Starches (such as fortified maize meal porridge, mashed sweet potatoes or mashed potatoes)  - Mashed, cooked vegetables (such as pumpkin, butternut, carrots)  - Soft fruit without pits (such as avocado, bananas, paw-paw, cooked apples)  - Give your baby clean and safe water to drink from a cup, regularly.</td>
<td>Start with 1 – 2 teaspoons, twice a day. Gradually increase the amount and frequency of foods.</td>
</tr>
<tr>
<td>9 – 11 months</td>
<td>Continue breastfeeding on demand. Breastfeed first, then give other foods.  - Iron rich foods are very important for your baby’s growth  - Increase the amount and variety (different kinds) of foods  - Food doesn’t need to be smooth as in the past months.  - Give your child small pieces of foods they can hold (bananas, bread, cooked carrots)  - Avoid small hard foods that may cause choking like peanuts.  - Give your baby safe water to drink from a cup, regularly.</td>
<td>About a ¼ cup, then increase to half a cup by 12 months 5 small meals a day</td>
</tr>
</tbody>
</table>

#### Your child’s age

<table>
<thead>
<tr>
<th>What foods to give</th>
<th>How much?</th>
</tr>
</thead>
<tbody>
<tr>
<td>12 months up to 5 years</td>
<td>Continue breastfeeding as often as your child wants up to 2 years and beyond. Give food before breastmilk.  - Give a variety (different kinds) of foods (iron rich foods, starches, vegetables, fruits)  - Give foods rich in vitamin A (livers, spinach, pumpkin, yellow sweet potatoes, mango, paw-paw, full cream milk, maas)  - Give Vitamin C rich foods (oranges, naartjies, guavas, tomatoes)  - Cut up foods in small pieces so that your child can eat on their own.  - Stay next to your child and encourage them to eat  - If not breastfeeding, you can start giving pasteurized full cream cow’s milk, maas or yoghurt. Follow up formula is not necessary  - Give your child clean, safe water to drink from a cup, during the day.</td>
</tr>
</tbody>
</table>

#### Remember:
- From the age of 6 months, give your baby clean, safe-to-drink water from a cup during the day. Boil the water and cool before you give it to your child.
- Always stay next to your child when they are eating.
- Keep food and cooking utensils very clean to prevent diarrhoea.
- Always wash your hands and your child’s hands with soap and water before preparing food, before eating, and after using the toilet and changing nappies.
- It’s not necessary to buy baby food or baby cereals. Homemade foods are good.
- Don’t give your child Rooibos tea or any other tea, coffee, creamers, condensed milk, flour water, sugar water, and cold drinks. These foods and drinks do not contain any nutrients and will not help your child to grow.
- Avoid giving your child unhealthy foods like chips, sweets, sugar and fizzy drinks.
- Infant formula increases risk of your baby getting diarrhoea, allergies, and breathing problems.
AGE 2 MONTHS UP TO 5 YEARS
ASSESS AND CLASSIFY THE SICK CHILD

CHECK FOR GENERAL DANGER SIGNS

A CHILD WITH ANY GENERAL DANGER SIGN NEEDS URGENT ATTENTION AND REFERRAL:
Quickly complete the assessment, give pre-referral treatment immediately and refer as soon as possible
**ASSESS AND CLASSIFY THE SICK CHILD AGE 2 MONTHS UP TO 5 YEARS**

**DOES THE CHILD HAVE A COUGH OR DIFFICULT BREATHING?**

**IF YES, ASK:**

**LOOK, LISTEN, FEEL:**

- For how long?
- Count the breaths in one minute.
- Look for chest indrawing.
- Look and listen for stridor or wheeze.
- If the pulse oximeter is available then determine oxygen saturation

**CLASSIFY COUGH OR DIFFICULT BREATHING**

- **Any general danger sign**
- **Chest indrawing**
- **Stridor in calm child**
- **Oxygen saturation less than 90% in room air**

**AND IF WHEEZE, ASK:**

- Has the child had a wheeze before this illness?
- Does the child frequently cough at night?
- Has the child had a wheeze for more than 7 days?
- Is the child on treatment for asthma at present?

**AND IF WHEEZE CLASSIFY**

**FAST BREATHING**

If the child is:

- 2 months up to 12 months
- 12 months up to 5 years

Fast breathing is:

- 50 or more breaths per minute
- 40 or more breaths per minute

**SEVERE PNEUMONIA OR VERY SEVERE DISEASE**

- Give oxygen (p. 36)
- If wheezing, give salbutamol by inhaler or nebuliser (p. 36) Reassess after 15 minutes, and reclassify for COUGH OR DIFFICULT BREATHING.
- If stridor: give nebulised adrenaline and prednisone (p. 36)
- Give first dose of ceftriaxone IM (p. 35)
- Give first dose cotrimoxazole (p. 38)
- Test for low blood sugar, then treat or prevent (p. 35)
- Keep child warm (p.11), and refer URGENTLY

**COUGH OR COLD**

- Fast breathing

**PNEUMONIA**

- If wheezing, give salbutamol by inhaler or nebuliser (p. 36) Reassess after 15 minutes, and reclassify for COUGH OR DIFFICULT BREATHING.
- Give amoxicillin for 5 days (p. 37)
- If coughing for more than 14 days, assess for TB (p. 33)
- Soothe the throat and relieve the cough (p. 44)
- Advise caregiver when to return immediately (p. 45)
- Follow-up in 2 days (p. 47)

**NO SIGNS OF PNEUMONIA OR VERY SEVERE DISEASE**

- No signs of pneumonia or very severe disease

**COUGH OR COLD**

- Fast breathing

**PNEUMONIA**

- If wheezing, give salbutamol by inhaler or nebuliser (p. 36) Reassess after 15 minutes, and reclassify for COUGH OR DIFFICULT BREATHING.
- Give amoxicillin for 5 days (p. 37)
- If coughing for more than 14 days, assess for TB (p. 33)
- Soothe the throat and relieve the cough (p. 44)
- Advise caregiver when to return immediately (p. 45)
- Follow up in 5 days if still wheezing (p. 47)

**RECURRENT WHEEZE**

- Yes to any question

**WHEEZE (FIRST EPISODE)**

- All other children with wheeze

- Fast breathing

**PNEUMONIA**

- If wheezing, give salbutamol by inhaler or nebuliser (p. 36) Reassess after 15 minutes, and reclassify for COUGH OR DIFFICULT BREATHING.
- Give salbutamol via spacer for 5 days

**RECURRENT WHEEZE**

- Give salbutamol and prednisone if referring for a severe classification (p. 36)
- Give salbutamol via spacer for 5 days

**ALL OTHER CHILDREN WITH WHEEZE**

- Give salbutamol if referring for a severe classification (p. 36)
- Give salbutamol via spacer for 5 days
- Follow-up in 5 days if still wheezing (p. 47)

# Does the Child Have Fever?

By history, by feel, or axillary temp is 37.5°C or above

## If Yes, Decide the Child’s Malaria Risk:

- **Malaria Risk** means: Lives in malaria zone or visited a malaria zone during the past 4 weeks. If in doubt, classify for malaria risk.

## Ask:

<table>
<thead>
<tr>
<th>For how long?</th>
</tr>
</thead>
<tbody>
<tr>
<td>stiff neck</td>
</tr>
<tr>
<td>bulging fontanelle</td>
</tr>
</tbody>
</table>

## Look and Feel:

- stiff neck
- bulging fontanelle

## AND If Malaria Risk:

- Do a rapid malaria test

## IF Malaria Test Not Available:

- Look for a cold with runny nose
- Look for another adequate cause of fever

## Consider Measles If:

- Generalized rash with any of the following:
  - Runny nose, **OR**
  - Red eyes, **OR**
  - Cough
  
  *Use the Measles chart (p. 28)*

## Classify Fever:

### Fever
- Any general danger sign
- Stiff neck or bulging fontanelle.

### Suspected Meningitis
- None of the above signs.
- Give first dose of ceftriaxone IM (p. 35)
- Test for low blood sugar, then treat or prevent (p. 35)
- Give one dose of paracetamol for fever 38°C or above (p. 40)
- Refer URGENTLY

### Fever Other Cause
- Give paracetamol for fever 38°C or above (p. 40)
- If fever present for more than 7 days, consider TB (p. 33)
- Treat for other causes
- Advise caregiver when to return immediately (p. 45)
- Follow-up in 2 days if fever persists (p. 49)

### Suspected Severe Malaria
- If Malaria test positive and child older then 12 months, treat for Malaria (p. 40)
- Treat for SUSPECTED MENINGITIS
- If age less than 12 months, refer URGENTLY
- If older than 12 months, treat for malaria (p. 40)
- Give paracetamol for fever 38°C or above (p. 40)
- Advise caregiver when to return immediately (p. 45)
- Notify confirmed malaria cases
- Follow-up in 2 days if fever persists (p. 49)

### Malaria
- Malaria test not done and PNEUMONIA
- Malaria test not done and no other adequate cause of fever found.
- Refer child to facility where Malaria Rapid Test can be done
- Give paracetamol for fever 38°C or above (p. 40)
- If fever present for more than 7 days, assess for TB (p. 33)

### Suspected Severe Malaria
- Malaria test negative.
- Malaria test not done and a cold with runny nose, or other adequate cause of fever found.
- Give paracetamol for fever 38°C or above (p. 40)
- If fever present for more than 7 days, assess for TB (p. 33)
- Treat for other causes
- Advise caregiver when to return immediately (p. 45)
- Follow-up in 2 days if fever persists (p. 49)
**MEASLES**

**Use this chart if the child has Fever and Generalised rash WITH Runny nose or Cough or Red eyes**

<table>
<thead>
<tr>
<th>ASK:</th>
<th>LOOK:</th>
<th>CLASSIFY FOR MEASLES</th>
<th>SUSPECTED COMPLICATED MEASLES</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Has the child been in contact with anyone with measles?</td>
<td>• Look for mouth ulcers.</td>
<td>• Any general danger sign OR • PNEUMONIA OR • Symptomatic HIV infection OR • Clouding of cornea. OR • Deep or extensive mouth ulcers.</td>
<td>• Give additional dose Vitamin A (p. 34) • If clouding of the cornea or pus draining from the eye, apply chloramphenicol eye ointment (p. 44) • Give first dose of amoxicillin (p. 37) unless child is receiving IM ceftriaxone for another reason. • REFER URGENTLY • Immunise all close contacts within 72 hours of exposure (a close contact is defined as who has been in the same room or vehicle as the child with measles)</td>
</tr>
<tr>
<td></td>
<td>• Are they deep and extensive?</td>
<td></td>
<td></td>

### Assess and Classify the Sick Child Age 2 Months Up to 5 Years

#### Look and Feel:
- Look for mouth ulcers.
- Are they deep and extensive? Weigh the child and plot the child’s weight-for-age in the RTHB.
- Look at the shape of the child’s weight curve. Does it show weight loss, unsatisfactory weight gain or satisfactory weight gain?
- If the child is 6 months or older measure the child’s Mid-Upper Arm Circumference (MUAC) and record in the child’s RTHB.
- If the child’s weight-for-age chart shows a prob-lem it is important to also measure and record their length/height for age and weight for length/height in the child’s RTHB to check for stunting and wasting, respectively.
- Look for oedema of both feet.
- Conduct an Appetite Test if indicated (p. 20)

* MUAC is Mid-Upper Arm Circumference which should be measured in all children 6 months or older using a MUAC tape.
* Growth curve flattening/decreasing is defined by changes on the growth curve over a 2-3 month period.

#### Classify All Children’s Nutritional Status

<table>
<thead>
<tr>
<th>One or more of the following</th>
<th>Severe Acute Malnutrition with Medical Complication</th>
<th>Moderate Acute Malnutrition</th>
<th>Acute Malnutrition without Medical Complication</th>
<th>Malnutrition without Medical Complication</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Oedema of both feet.</td>
<td>• Test for low blood sugar, then prevent (p. 35)</td>
<td>• Give amoxicillin for 5 days (p. 37)</td>
<td>• Give dose of Vitamin A (p. 34) and treat for worms if due (p. 34)</td>
<td>• Give dose of Vitamin A (p. 34) and treat for worms if due (p. 34)</td>
</tr>
<tr>
<td>• Weight for length/height Z-score less than -3 OR MUAC ≤ 11.5 cm AND</td>
<td>• Assess of the child’s feeding and counsel the caregiver on the feeding recommendations (p. 16 - 23)</td>
<td>• Assess for possible HIV &amp; TB infection (p. 32 &amp; 33)</td>
<td>• Assess the child’s feeding and counsel the caregiver on the feeding recommendations (p. 16 - 23)</td>
<td>• Assess for possible HIV &amp; TB infection (p. 32 &amp; 33)</td>
</tr>
<tr>
<td>• No oedema of both feet</td>
<td>• Give dose of Vitamin A (p. 34) and treat for worms if due (p. 34)</td>
<td>• Give RUTF or other supplements according to local guidelines (p. 41)</td>
<td>• Assess for possible HIV &amp; TB infection (p. 32 &amp; 33)</td>
<td>• Assess for possible HIV &amp; TB infection (p. 32 &amp; 33)</td>
</tr>
<tr>
<td>• Six months or older</td>
<td>• Assess the child’s feeding and counsel the caregiver on the feeding recommendations (p. 16 - 23)</td>
<td>• Advise caregiver when to return immediately (p. 45)</td>
<td>• Provide RUTF or other supplements according to local guidelines (p. 41)</td>
<td>• Advise caregiver when to return immediately (p. 45)</td>
</tr>
<tr>
<td>• Weighs 4 kg or more</td>
<td>• Make sure that the has a birth certificate, and is receiving a child support grant if eligible.</td>
<td>• Make sure that the has a birth certificate, and is receiving a child support grant if eligible.</td>
<td>• Advise caregiver when to return immediately (p. 45)</td>
<td>• Advise caregiver when to return immediately (p. 45)</td>
</tr>
<tr>
<td>• No other RED or YELLOW classification</td>
<td>• Refer to other available services if indicated (CHW, social worker, community based organisations)</td>
<td>• Refer to other available services if indicated (CHW, social worker, community based organisations)</td>
<td>• Follow up in 7 days (p. 48)</td>
<td>• Follow up in 7 days (p. 48)</td>
</tr>
</tbody>
</table>

- Losing weight OR
- Weight gain unsatisfactory OR
- Low or very low weight OR
- Low length for age (children below 24 months)
- No oedema of both feet

#### Additional Steps

- Provide RUTF or other supplements according to local guidelines (p. 41)
- Assess the child’s feeding and counsel the caregiver on the feeding recommendations (p. 16 - 23)
- Assess for possible HIV & TB infection (p. 32 & 33)
- Treat for worms and give Vitamin A if due (p. 34)
- Make sure that the has a birth certificate, and is receiving a child support grant if eligible.
- Refer to other available services if indicated (CHW, social worker, community based organisations)
- Follow up in 7 days (p. 48)

- Weight for length/height greater than +2 z-score
- Weight normal AND
- Weight gain satisfactory AND
- Weight for length/height –2 z-score or more OR MUAC 12.5 cm or more

- Overweight / Obesity
- Growing Well
- Praise the caregiver
- If the child is less than 2 years old, assess feeding and counsel the caregiver on feeding according to the feeding recommendations (p. 18 - 20)
- If feeding problem, follow up in 7 days (p. 48)
- Encouraging healthy eating habits for entire family (p. 23)
- Provide advice on physical activity (p. 21)
- Assess feeding, and counsel caregiver (p. 23)
- Provide dietary counseling (p. 22)
- Encouraging healthy eating habits for entire family (p. 23)
- Provide advice on physical activity (p. 21)
THEN CHECK **ALL CHILDREN FOR ANAEMIA**

**LOOK:**
- Look for palmar pallor. Is there:
  - Severe palmar pallor?
  - Some palmar pallor?
  - If any pallor, check haemoglobin (Hb) level.

**NOTE:**
- **DO NOT** give Iron if the child is receiving RUTF. Small amounts are available in RUTF.
- Iron is extremely toxic in overdose, particularly in children. All medication should be stored out of reach of children.

<table>
<thead>
<tr>
<th>Severe Anaemia</th>
<th>Refer URGENTLY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Severe palmar pallor OR</td>
<td>HB &lt; 7g/dl</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Anaemia</th>
<th>Give iron (p. 41) and counsel on iron-rich foods .</th>
</tr>
</thead>
<tbody>
<tr>
<td>Some palmar pallor OR</td>
<td>Hb 7 g/dl up to 11 g/dl.</td>
</tr>
<tr>
<td>Anaemia</td>
<td>Assess feeding and counsel regarding any feeding problems (p. 17 - 23)</td>
</tr>
<tr>
<td>Anaemia</td>
<td>Treat for worms if due (p. 34)</td>
</tr>
<tr>
<td>Anaemia</td>
<td>Advise caregiver when to return immediately (p. 45)</td>
</tr>
<tr>
<td>Anaemia</td>
<td>Follow-up in 14 days (p. 48)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>No Ear Infection</th>
<th>If child is less than 2 years, assess feeding and counsel (p. 17 - 20)</th>
</tr>
</thead>
<tbody>
<tr>
<td>No pallor.</td>
<td></td>
</tr>
</tbody>
</table>
**ASSESS AND CLASSIFY THE SICK CHILD AGE 2 MONTHS UP TO 5 YEARS**

**THEN CHECK ALL CHILDREN FOR HIV INFECTION**

**IF YES, ASK:**

- What was the result?
- If the test was positive, is the child on ART?
- If the test was negative, was the child still breastfeeding at the time that the test was done, or had the child been breastfed in the 6 weeks before the test was done? Is the child still breastfeeding?

**HIV TESTING IN CHILDREN:**

- All HIV-exposed infants should have been tested at birth. Ensure you obtain the result.
- If the test was negative, re-test:
  - At 10 weeks of age— all HIV-exposed infants.
  - At 6 months of age— all HIV-exposed infants.
  - If the child is ill or has features of HIV infection
  - 6 weeks after stopping breastfeeding.
- Universal HIV rapid test at 18 months for all infants, regardless of HIV exposure.

**Below 18 months of age,** use an HIV PCR test as the first HIV test. If HIV PCR is positive, do a second HIV PCR test to confirm the child’s status.

**Between 18 months and 2 years,** use an HIV antibody (rapid) test as the first HIV test, but an HIV PCR test to confirm the child’s HIV status. HIV PCR should be used to confirm any positive HIV test up to 2 years.

**2 years and older,** use an HIV antibody (rapid) test as the firsts HIV test. If positive, use a confirmatory HIV antibody (rapid) test kit. If the confirmatory test is positive, this confirms HIV infection. If the second test is negative, refer for ELISA test and assessment.

**ASK:**

- What was the result?
- If the test was positive, is the child on ART?
- If the test was negative, was the child still breastfeeding at the time that the test was done, or had the child been breastfed in the 6 weeks before the test was done? Is the child still breastfeeding?

**FEATURES OF HIV INFECTION**

**ASK:**

- Does the child have PNEUMONIA now?
- Is there PERSISTENT DIARRHOEA, now or in the past 3 months?
- Has the child ever had ear discharge?
- Is there low weight?
- Has weight gain been unsatisfactory?

**LOOK and FEEL:**

- Any enlarged lymph glands in two or more of the following sites - neck, axilla or groin?
- Is there oral thrush?
- Is there parotid enlargement?

**Has the child been tested for HIV infection?**

**CLASSIFY FOR HIV INFECTION IN THE CHILD**

**Positive HIV test in child, OR Child on ART**

- Follow the six steps for initiation of ART (p. 52).
- Give cotrimoxazole prophylaxis from 6 weeks (p. 38).
- Ask about the caregiver’s health and manage appropriately.
- Provide long term follow-up (p. 57).

**Infant is receiving ARV prophylaxis**

- Complete appropriate ARV prophylaxis (p. 12).
- Give cotrimoxazole prophylaxis from 6 weeks (p. 38).
- Repeat PCR test according to testing schedule. Reclassify on the basis of the test result.
- Ask about the caregiver’s health, and ensure that she is receiving the necessary care and treatment.
- Provide follow-up care (p. 50)

**Negative HIV test AND Child still breastfeeding or stopped breastfeeding < 6 weeks before the test.**

- Negative HIV test.
- All breastfeeding stopped ≥6 weeks before the test.

**3 or more features of HIV infection.**

- Give cotrimoxazole prophylaxis (p. 38).
- Counsel and offer HIV testing for the child. Reclassify the child on the basis of the test result.
- Counsel the caregiver about her health, offer HIV testing (if mother tests HIV positive: offer same-day initiation).
- Provide long-term follow-up (p. 50).

**Mother HIV-positive**

- Give infant ARV prophylaxis (p.14).
- Give cotrimoxazole prophylaxis (p. 38).
- Counsel and offer HIV testing for the child. Reclassify based on the test result.
- Counsel the caregiver about her health, and provide treatment as necessary.
- If mother is not on ART: start ART immediately.
- If mother is on ART: check the mother’s VL and if suppressed repeat VL every 6 months while breastfeeding.
- Provide long-term follow-up (p. 50).

**One or two features of HIV infection**

- Provide routine care including HIV testing for the child.
- Counsel the caregiver about her health, offer HIV testing and treat-ment as necessary.
- Reclassify the child based on the test results.

**No features of HIV infection**

- Provide routine care including HIV testing for the child and caregiver. (If mother is HIV negative, retest at the 10 week visit, 6 month visit and every 3 months while breastfeeding).

**Ongoing HIV EXPOSURE**

**HIV-NEGATIVE**

- Stop cotrimoxazole.
- Consider other causes if child has features of HIV infection (repeat HIV test if indicated).

**SUSPECTED SYMPTOMATIC HIV INFECTION**

**If HIV test if indicated).**

- Follow the six steps for initiation of ART (p. 52).
- Give cotrimoxazole prophylaxis from 6 weeks (p. 38).
- Ask about the caregiver’s health and manage appropriately.
- Provide long term follow-up (p. 57).

**HIV EXPOSED. ON ARV PROPHYLAXIS**

- Complete appropriate infant ARV prophylaxis (p. 12)
- Give cotrimoxazole prophylaxis from 6 weeks (p. 38)
- Repeat HIV testing when indicated. Reclassify the child based on the test result.
- Provide follow-up care (p. 50)

**ONGOING HIV EXPOSURE**

- Complete appropriate infant ARV prophylaxis (p. 12)
- Give cotrimoxazole prophylaxis from 6 weeks (p. 38)
- Repeat HIV testing when indicated. Reclassify the child based on the test result.
- Provide follow-up care (p. 50)

**ASK:**

- Has the child been tested for HIV infection?
**CLASSIFY ALL CHILDREN FOR TB RISK**

**ASK**

- Any history of TB contact in the past twelve months?
- Screening questions
- Cough for more than two weeks?
- Fever for more than seven days?
- NOT GROWING WELL?

---

**FULL TB ASSESSMENT**

**STEP 1: ASK ABOUT FEATURES OF TB:**
- Persistent, non-remitting cough or wheeze for more than 2 weeks.
- Documented loss of weight or unsatisfactory weight gain during the past 3 months (especially if not responding to deworming together with food and/or micronutrient supplementation).
- Fatigue/reduced playfulness.
- Fever every day for 14 days or more.

**STEP 2: SEND SPUTUM OR GASTRIC ASPIRATE FOR EXPERT AND CULTURE**

**STEP 3: DO A TST**

**STEP 4: IF AVAILABLE DO OR SEND CHILD FOR A CXR**

---

**THEN CLASSIFY FOR TB**

**ASK ABOUT FEATURES OF TB:**

**REVIEW RESULTS OF SPUTUM/GASTRIC ASPIRATE:**
- Are they positive or negative?
- IS THE TST POSITIVE OR NEGATIVE?
  - Check the Tuberculin Skin Test - If it measures more than 10 mm (or 5 mm in an HIV infected child) it is positive.
  - Is it suggestive of TB?

**CLASSIFY FOR TB RISK**

**CONFIRMED TB**
- TB culture or Expert positive OR
- Referred with diagnosis of TB

**PROBABLE TB**
- Two or more features of TB present AND
- Close TB contact or TST positive

**POSSIBLE TB**
- One or more feature of TB persist, but Expert is negative and CXR not suggestive of TB

**UNLIKELY TB**
- No features of TB present AND
- Close TB contact or TST positive

**TB EXPOSED**
- No close TB contact AND
- No features of TB present

**CLASSIFY FOR TB RISK**

**HIGH RISK OF TB**
- A close TB contact. AND
- Answers YES to any of screening questions

**LOW RISK OF TB**
- A close TB contact AND
- No features of TB

**TB EXPOSED**
- No close TB contact AND
- No features of TB present

**NOTE:**

* A close TB contact is an adult who has had pulmonary TB in the last 12 months, who lives in the same household as the child, or some-one with whom the child is in close contact or in contact for extended periods.

If in doubt, discuss the case with an expert or refer the child.

Chest X-rays can assist in making the diagnosis of TB in children. Decisions as to how they are used in your area should be based on the availability of expertise for taking and interpreting good quality X-rays in children. Follow local guidelines in this regard. Although it is advisable that all children should have a CXR before TB treatment is commenced, where good quality CXR are not available, do not delay treatment. If you are unsure about the diagnosis of TB, refer the child for assessment and investigation.

**ASSESS AND CLASSIFY THE SICK CHILD**

**AGE 2 MONTHS UP TO 5 YEARS**
THEN CHECK THE CHILD’S IMMUNISATION STATUS AND GIVE ROUTINE TREATMENTS

IMMUNISATION SCHEDULE:

<table>
<thead>
<tr>
<th>Age</th>
<th>BCG</th>
<th>OPV0</th>
<th>HepB0</th>
</tr>
</thead>
<tbody>
<tr>
<td>6 weeks</td>

</table>

• Give all missed immunisations on this visit (observing contraindications).
• This includes sick children and those without a RTHB.
• If the child has no RTHB, give a new one today.
• Advise caregiver when to return for the next immunisation.
• Give routine treatment for worms (p. 34) and record on the RTHB.
• Refer to the EPI Vaccinators Manual or EDL for catch up schedule and contraindications
• Make sure that the child has a birth certificate. If not, refer to Home Affairs or to social worker.
• Make sure that eligible children are receiving a child support grant. If not refer to SASSA or social worker.

ASSESS ANY OTHER PROBLEM e.g. Skin rash or infection, eye INFECTION

CHECK THE CAREGIVER’S HEALTH

GIVE VITAMIN A

• Give Vitamin A routinely to all children from the age of 6 months to prevent severe illness (prophylaxis).
• If the child has had a dose of Vitamin A in the past 30 days, defer Vitamin A until 30 days has elapsed.
• Vitamin A is not contraindicated if the child is on multivitamin treatment.
• Vitamin A capsules come in 100 000 IU and 200 000 IU.
• Record the date Vitamin A given on the RTHB.

ROUTINE VITAMIN A*

AGE 6 up to 12 months
A single dose of 100 000 IU at age 6 months or up to 12 months

AGE 1 up to 5 years
A single dose of 200 000 IU at 12 months, then a dose of 200 000 IU every 6 months up to 5 years

ADDITIONAL DOSE FOR SEVERE MALNUTRITION, PERSISTENT DIARRHOEA, MEASLES OR XEROPHTHALMIA

• Give therapeutic (non-routine) dose of Vitamin A if the child has severe acute malnutrition, persistent diarrhoea, measles or xerophthalmia (dry eyes).
• If the child has measles or xerophthalmia (dry eyes), give caregiver a second dose to take the next day.

AGE < 6 months Vitamin A Additional dose
50 000 IU

AGE 6 up to 12 months Vitamin A Additional dose
100 000 IU

AGE 1 up to 5 years Vitamin A Additional dose
200 000 IU

GIVE MEBENDAZOLE OR ALBENDAZOLE

• Children older than one year of age should receive routine deworming treatment every 6 months.
• Give Mebendazole or Albendazole.
• Give single dose (or first dose of ) in the clinic.
• Record the dose in the child’s RTHB.

MEBENDAZOLE

GIVE THESE TREATMENTS IN THE CLINIC ONLY

PREVENT LOW BLOOD SUGAR (HYPOGLYCAEMIA)

- If the child is able to swallow:
  - If breastfed: ask the mother to breastfeed the child, or give expressed breastmilk.
  - If not breastfed: give a breastmilk substitute or sugar water. Give 30 - 50 ml of milk or sugar water before the child leaves the facility.
  - To make sugar
- If the child is not able to swallow:
  - Insert nasogastric tube and check the position of the tube.

TREAT FOR LOW BLOOD SUGAR (HYPOGLYCAEMIA)

Low blood sugar < 3 mmol/L in a child
- Suspect low blood sugar in any infant or child that:
  - is convulsing, unconscious or lethargic; OR
  - has a temperature below 35°C.
- Children with severe malnutrition are particularly likely to be hypoglycaemic.
- Confirm low blood sugar using blood glucose testing strips.
  - Treat with:
    - 10% Glucose - 5 ml for every kg body weight - by nasogastric tube OR intravenous line.
    - Keep warm.
    - Refer urgently and continue feeds during transfer.
  - If neonatyle not available add 1 part 50% dextrose water to 4 parts water to make 10% solution.

TREAT FOR LOW BLOOD SUGAR (HYPOGLYCAEMIA)

- Encourage the caregiver to continue breastfeeding and giving F-75 during referral.
- Give one feed immediately. Repeat two hourly until the child reaches the hospital.
- Keep the child warm (p. 12)

GIVE DIAZEPAM TO STOP CONVULSIONS

- Turn the child to the side and clear the airway. Avoid putting things in the mouth.
- Give 0.5 mg per kg diazepam injection solution per rectum. Use a small syringe without a needle or a catheter.
- Test for low blood sugar, then treat or prevent.
- Give oxygen (p. 36).
- REFER URGENTLY.
  - If convulsions have not stopped after 10 minutes, repeat the dose once while waiting for transport.

WEIGHT | Age | F - 75
---|---|---
3 - < 4 kg | 0 up to 2 months | 2 mg (0.4 ml)
4 - < 5 kg | 2 up to 3 months | 2.5 mg (0.5 ml)
5 - < 15 kg | 3 up to 24 months | 5 mg (1 ml)
15 - 25 kg | 2 up to 5 years | 7.5 mg (1.5 ml)

GIVE CEFTRIAXONE IM

- Wherever possible use the weight to calculate the dose.
- Dilute 250 mg vial with 1 ml of sterile water, or 500 mg with 2 ml sterile water (250 mg per ml).
- Give the injection in the upper thigh, not the buttocks.
- IF REFERRAL IS NOT POSSIBLE OR DELAYED, repeat the ceftriaxone injection every 24 hours.
- For children weighing more than 17.5 kg, dilute 1g in 3.5 ml sterile water, and give 5.5 ml IM.

WEIGHT | Age | F - 75
---|---|---
3.5 - < 7 kg | 1 up to 3 months | 312 mg (1.25 ml)
5.5 - < 7 kg | 3 up to 6 months | 440 mg (1.75 ml)
7 - < 9 kg | 6 up to 12 months | 625 mg (2.5 ml)
9 - < 11 kg | 12 up to 18 months | 750 mg (3 ml)
11 - < 14 kg | 18 months up to 3 years | 810 mg (3.25 ml)
14 - < 17.5 kg | 3 up to 5 years | 1g (4 ml)
Give 2 ml in each thigh | 2 up to 5 years | 7.5 mg (1.5 ml)
≥17.5 kg | 5 years and older | See above

EXPLORE THE REASONS FOR THE SICKNESS: 
- Explain to the caregiver why the medicine is given.
- Determine the dose appropriate for the child’s weight (or age).
- Measure the dose accurately.

WEIGHT | Age | F - 75
---|---|---
3.0 - < 5 kg | 60 ml
5 - < 8 kg | 90 ml
≥ 8 kg | 120 ml

ASSESS AND CLASSIFY THE SICK CHILD AGE 2 MONTHS UP TO 5 YEARS
ASSESS AND CLASSIFY THE SICK CHILD \textbf{AGE 2 MONTHS UP TO 5 YEARS}

THEN CHECK THE CHILD’S IMMUNISATION STATUS AND GIVE ROUTINE TREATMENTS

**GIVE OXYGEN**

- Give oxygen to all young infants with:
  - severe pneumonia, with or without wheeze
  - lethargy or if the child is unconscious
  - convulsions
- Use nasal prongs or a nasal cannula.

**Nasal prongs**

- Place the prongs just inside or below the baby’s nostrils.
- For term babies
- Secure the prongs with tape
- Oxygen should flow 1 - 2 litres per minute

**Nasal cannula**

- This method delivers a higher concentration of oxygen
- Insert a FG8 nasogastric tube.
- Measure the distance from the side of the nostril to the inner eyebrow margin with the catheter.
- Insert the catheter as shown in the diagramme.
- Secure with tape
- Turn on oxygen to flow of half to one a litre per minute

**GIVE PREDNISONE FOR STRIDOR OR RECURRENT WHEEZE WITH SEVERE CLASSIFICATION**

- Give one dose of prednisone as part of pre-referral treatment for stridor or for recurrent wheeze with severe classification.

<table>
<thead>
<tr>
<th>WEIGHT</th>
<th>AGE</th>
<th>PREDNISONE 5 mg</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 8 kg</td>
<td>-</td>
<td>2 tabs</td>
</tr>
<tr>
<td>&lt; 8 kg</td>
<td>Up to 2 years</td>
<td>4 tabs</td>
</tr>
<tr>
<td></td>
<td>2 - 5 years</td>
<td>6 tabs</td>
</tr>
</tbody>
</table>

**GIVE NEBULIZED ADRENALINE FOR STRIDOR**

- Add 1 ml of 1:1000 adrenaline (one vial) to 1 ml of saline and administer using a nebulizer.
- Always use oxygen at flow-rate of 6 - 8 litres.
- Repeat every 15 minutes, until the child is transferred (or the stridor disappears)
- Give one dose of prednisone as part of pre-referral treatment for stridor

**GIVE IM PENICILLIN FOR POSSIBLE STREPTOCOCCAL INFECTION**

**GIVE IM SINGLE DOSE OR ORAL TREATMENT TWICE DAILY (P. 37)**

- IM Penicillin is the treatment of choice (see below).
- Give azithromycin if the child is allergic to penicillin (p. 37)
- Only give oral penicillin if the caregiver does not want the child to have an injection (p. 37).
- Dilute 1.2 million units with 3 ml of sterile water or 3.2 ml of lidocaine 1% without adrenaline.

<table>
<thead>
<tr>
<th>WEIGHT</th>
<th>Age</th>

</thead>
<tbody>
<tr>
<td>Up to 30 kg</td>
<td>3 up to 5 years</td>
<td>1.6 ml 1.2mu in 3.2 ml lidocaine 1% without adrenaline</td>
</tr>
</tbody>
</table>

**GIVE SALBUTAMOL FOR WHEEZE WITH SEVERE CLASSIFICATION**

- Dilute 1ml in 3 ml saline.
- Nebulise in the clinic.
- Always use oxygen at flow rate of 6-8 litres.
- If still wheezing repeat every 15 minutes in first hour and 2 - 4 hourly thereafter.
- Add Ipratropium bromide 0.5 ml if available

<table>
<thead>
<tr>
<th>SALBUTAMOL</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Nebulised salbutamol (2.5 ml nebul)</td>
<td>Dilute 1ml in 3 ml saline. Nebulise in the clinic. Always use oxygen at flow rate of 6-8 litres. If still wheezing repeat every 15 minutes in first hour and 2 - 4 hourly thereafter. Add Ipratropium bromide 0.5 ml if available</td>
</tr>
</tbody>
</table>

**OR**

| MDI - 100 ug per puff | 4 - 8 puffs using a spacer. Allow 4 breaths per puff. If still wheez |
TREAT THE SICK CHILD

Carry out the treatment steps identified on the assess and classify chart

TEACH THE CAREGIVER TO GIVE ORAL MEDICINES AT HOME

Follow the general instructions below for all oral medicines to be given at home
Also follow the instructions listed with the dosage table for each medicine
- Determine the appropriate medicines and dosage for the child’s weight or age.
- Tell the caregiver the reason for giving the medicine to the child.
- Demonstrate how to measure a dose.
- Watch the caregiver practise measuring a dose by herself.
- Explain carefully how to give the medicine.
- Ask the caregiver to give the first dose to her child.
- Advise the caregiver to store the medicines safely.
- Explain that the course of treatment must be finished, even if the child is better.
- Check the caregiver’s understanding before she leaves the clinic.

GIVE AMOXICILLIN* FOR PNEUMONIA, ACUTE EAR INFECTION OR SEVERE ACUTE MALNUTRITION WITHOUT MEDICAL COMPLICATIONS

- Give three times daily for 5 days.
- If the child is allergic to penicillins, or amoxicillin is out of stock, use azithromycin

<table>
<thead>
<tr>
<th>WEIGHT</th>
<th>Age</th>
<th>AMOXICILLIN</th>

<td>17.5 - &lt; 25 kg</td>
<td>3 up to 5 years</td>
<td>6ml</td>
<td></td>
</tr>
</tbody>
</table>

GIVE PENICILLIN FOR POSSIBLE STREPTOCOCCAL INFECTION

- Give twice a day for 10 days
- The recommended treatment for POSSIBLE STREPTOCOCCAL INFECTION is IM Benzathine Benzylpenicillin (p. 36).
- Only give oral penicillin if the caregiver refuses an injection.
- If the child is allergic, use azithromycin instead.

<table>

TEACH THE CAREGIVER TO GIVE ORAL MEDICINES AT HOME

INH FOR TB EXPOSURE
GIVE ONCE DAILY

- Follow the general instructions for all oral medicines to be given at home.
- Tablets can be crushed and dissolved in water if necessary
- Treatment must be given for 6 months.
- Follow-up children each month (p. 51) to check adherence and progress, and to provide medication.

<table>

Preventative therapy in case of drug-resistant TB contact:

Isoniazid mono-resistant contact:
Rifampicin, oral, 15 mg/kg for 4 months

Rifampicin mono-resistant contact:
Isoniazid, oral, 10 mg/kg daily for 6 months (see table above)

GIVE COTRIMOXAZOLE
GIVE ONCE DAILY AS PROPHYLAXIS

- Give from 6 weeks to all HIV or exposed children unless child is HIV NEGATIVE.
- Continue cotrimoxazole until the child is shown to be HIV-uninfected AND has not been breastfed for the last 6 weeks.
- Give to all children with HIV INFECTION (criteria for stopping in children on ART are shown below).

<table>
<thead>
<tr>
<th>INDICATIONS</th>

TEACH THE CAREGIVER TO GIVE ORAL MEDICINES AT HOME

- Follow the general instructions for all oral medicines to be given at home.
- Also follow the instructions listed with the dosage table of each medicine.
- Do not change the regimen of children referred from hospital or a TB clinic without discussing this with an expert.
- Treatment should be given as Directly Observed Treatment (DOT) 7 days a week.
- Follow-up children each month (p. 51) to check adherence and progress.

GIVE REGIMEN 3A FOR UNCOMPLICATED TB

- Uncomplicated TB includes low bacilliary load TB disease such as pulmonary TB with minimal lung parenchymal involvement (with or without involvement of hilar nodes), TB lymphadenitis and TB pleural effusion.
- Any child with a positive Xpert or culture result must be treated with Regimen 3B.
- All children should receive Rifampicin/INH (RH) together with pyrazinamide (PZA) for two months followed by RH for a further four months.
- For small infants dissolve one dispersible PZA tablet (150 mg) in 3 ml of water.
- Add Pyridoxine 12.5 mg daily for 6 months if the child is HIV positive or malnourished.

<table>
<thead>
<tr>
<th>REGIMEN 3A</th>
<th>INTENSIVE PHASE TWO MONTHS Once daily</th>

</tr>
</tbody>
</table>

GIVE REGIMEN 3B FOR COMPLICATED TB

- Use this regimen in children with all forms of severe TB (extensive pulmonary TB, spinal or osteo-articular TB or abdominal TB) or retreatment cases.
- All children should receive four medicines during the intensive phase (Rifampicin/INH (RH), pyrazinamide (PZA) and ethambutol) for two months. This is followed by RH for a further four months (continuation phase).
- For small infants dissolve one dispersible PZA tablet (150 mg) in 3 ml of water.
- To make ethambutol solution, crush one tablet (400 mg) to a fine powder and dissolve in 8 ml of water. Discard unused solution.
- Add Pyridoxine 12.5 mg daily for 6 months if the child is HIV positive or malnourished.

ASSESS AND CLASSIFY THE SICK CHILD AGE 2 MONTHS UP TO 5 YEARS
TEACH THE CAREGIVER TO GIVE MEDICINES AT HOME

- Follow the general instructions for all oral medicines to be given at home.
- Also follow the instructions listed with the dosage table of each medicine.

TREAT FOR MALARIA

- Give the current malaria treatment recommended for your area. See the Malaria Treatment Guidelines.
- Treat only test-confirmed malaria. Refer if unable to test, or if the child is unable to swallow, or is under one year of age.
- Record and notify malaria cases.

In all provinces combination therapy (Co-ArtemR) must be used. It is advisable to consult the provincial guidelines on a regular basis.

Artemether + Lumefantrine (Co-ArtemR)

- Watch the caregiver give the first dose of Co-ArtemR in the clinic and observe for one hour. If the child vomits within an hour repeat the dose.
- Give Co-Artemether with fat-containing food/milk to ensure adequate absorption.
- Give first dose immediately
- Second dose should be taken at home 8 hours later. Then twice daily for two more days.

<table>
<thead>
<tr>
<th>WEIGHT</th>

**ASSESS AND CLASSIFY THE SICK CHILD AGE 2 MONTHS UP TO 5 YEARS**

### TEACH THE CAREGIVER TO GIVE ORAL MEDICINES AT HOME

- Follow the general instructions for every oral medicines to be given at home.
- Also follow the instructions listed with the dosage table of each medicine.

### GIVE IRON FOR ANAEMIA

- Give three doses daily. Supply enough for 14 days.
- Follow-up every 14 days and continue treatment for 2 months.
- Each dose is 2 mg elemental iron for every kilogram weight. Elemental iron content depends on the preparation you have.
- Check the strength and dose of the iron syrup or tablet very carefully.
- Tell caregiver to keep iron out of reach of children, because an overdose is very dangerous.
- REMEMBER: Do not give iron if the child is receiving the RUTF, as RUTF contains sufficient iron.

<table>
<thead>
<tr>

### GIVE RUTF TO SAM WITHOUT MEDICAL COMPLICATION AND ELIGIBLE MAM CASES (SEE P.48 FOR CRITERIA)

- The child should be at least 6 months of age and weigh more than 4 kg.
- Make sure that the caregiver knows how to use the RUTF (p. 20)
- The child may have been referred from hospital for ongoing care. Give amounts according to directions from the referring facility, or according to local guidelines.

GIVE EXTRA FLUID FOR DIARRHOEA AND CONTINUE FEEDING

**PLAN A: TREAT FOR DIARRHOEA AT HOME**

Counsel the caregiver on the 4 Rules of Home Treatment:

1. **GIVE EXTRA FLUID** (as much as the child will take).
   - COUNSEL THE CAREGIVER:
     - Breastfeed frequently and for longer at each feed.
     - If the child is exclusively breastfed, give sugar-salt solution (SSS) or ORS in addition to breastmilk.
     - If the child is not receiving breastmilk or is not exclusively breastfed, give one or more of the following: food-based fluids such as soft porridge, amasi (maas) or SSS or ORS.
     - It is especially important to give ORS at home when:
       - the child has been treated with Plan B or Plan C during this visit
       - the child cannot return to a clinic if the diarrhoea gets worse
   - TEACH THE CAREGIVER HOW TO MIX AND GIVE SSS or ORS:
     - To make SSS:
       1 litre boiled water + 8 level teaspoons sugar + half a level teaspoon salt.
     - SSS is the solution to be used at home to prevent dehydration.
   - SHOW THE CAREGIVER HOW MUCH FLUID TO GIVE IN ADDITION TO THE USUAL FLUID INTAKE:
     - Up to 2 years: 50 to 100 ml after each loose stool.
     - 2 years or more: 100 to 200 ml after each loose stool.
   - Counsel the caregiver to:
     - Give frequent small sips from a cup.
     - If the child vomits, wait 10 minutes. Then continue, but more slowly.
     - Continue giving extra fluid until the diarrhoea stops

2. **GIVE ZINC** (p. 41)

3. **CONTINUE FEEDING** (p. 17 - 23)

4. **WHEN TO RETURN** (p. 14 or p. 45)

**PLAN B: TREAT FOR SOME DEHYDRATION WITH ORS**

In the clinic: Give recommended amount of ORS over 4-hour period

- **DETERMINE AMOUNT OF ORS TO GIVE DURING FIRST 4 HOURS.**
  - The amount of ORS needed each hour is about 20 ml for each kilogram weight. Multiply the child’s weight in kg by 20 for each hour. Multiply this by four for the total number of ml over the first four hours. One teacup is approximately 200 ml.
  - SHOW THE CAREGIVER HOW TO GIVE ORS SOLUTION:
    - Give frequent small sips from a cup.
    - If the child vomits, wait 10 minutes. Then continue, but more slowly.
    - Counsel the mother to continue breastfeeding whenever the child wants.
    - If the child wants more ORS than shown, give more.
  - **AFTER 4 HOURS:**
    - Reassess the child and classify the child for dehydration.
    - Select the appropriate plan to continue treatment.
    - Begin feeding the child in clinic.
  - **IF CAREGIVER MUST LEAVE BEFORE COMPLETING TREATMENT, OR THE CLINIC IS CLOSING:**
    - Refer if possible. Otherwise:
      - Show her how to prepare ORS solution at home.
      - Show her how much ORS to give to finish the 4-hour treatment at home.
      - Explain the Four Rules of Home Treatment:
        1. **GIVE EXTRA FLUID**
        2. **GIVE ZINC** (p. 41)
        3. **CONTINUE FEEDING** (p. 17 - 23)
        4. **WHEN TO RETURN** (p. 14 or p. 45)
GIVE EXTRA FLUID FOR DIARRHOEA AND CONTINUE FEEDING

PLAN C: TREAT SEVERE DEHYDRATION QUICKLY *

Can you give intravenous (IV) fluid immediately?

YES

NO

Is IV treatment available nearby (within 30 minutes)?

YES

NO

Are you trained to use a nasogastric (NG) tube for rehydration?

YES

NO

Can the child drink?

YES

NO

Refer URGENTLY to hospital for IV

• Start IV fluid immediately. If the child can drink, give ORS by mouth while the drip is set up. Weigh the child or estimate the weight.

Within the first half hour:

• Rapidly give 20 ml IV for each kilogram weight, before referral (weight x 20 gives ml needed).
• Repeat this amount up to twice if the radial pulse is weak or not detectable.

Plan for the next 5 hours:

• More slowly give 20 ml IV for each kilogram weight, every hour, during referral.
• Ensure the IV continues running, but does not run too fast.

• Give Normal Saline IV:

• REFER URGENTLY for further management.

• Reassess the child every 1-2 hours while awaiting transfer. If hydration status is not improving, give the IV drip more rapidly.

• Also give ORS (about 5 ml per kilogram each hour) as soon as the child can drink: usually after 3-4 hours (infants) or 1-2 hours.

• Refer URGENTLY to hospital for IV treatment.

• If the child can drink, provide caregiver with ORS solution and show her how to give frequent sips during the trip, or give ORS by nasogastric tube.

• Start rehydration with ORS solution, by tube: give 20 ml per kg each hour for 6 hours (total of 120 ml per kg).

• REFER URGENTLY for further management.

• Reassess the child every 1-2 hours while awaiting transfer:

- If there is repeated vomiting give the fluid more slowly.
- If there is abdominal distension stop fluids and refer urgently.
- After 6 hours reassess the child if he/she is still at the clinic. Classify dehydration. Then choose the appropriate plan (A, B, or C) to continue treatment.

NOTE: If possible, observe the child at least 6 hours after rehydration, to be sure the caregiver can maintain hydration giving the child ORS by mouth.

* Exception: Another severe classification e.g. suspected meningitis, severe malnutrition

• Too much IV fluid is dangerous in very sick children. Treatment should be supervised very closely in hospital.

• Set up a drip for severe dehydration, but give Normal Saline only 10 ml per kilogram over one hour.

• Then give sips of ORS while awaiting urgent referral.
TEACH THE CAREGIVER TO TREAT LOCAL INFECTIONS

- Explain how the treatment is given.
- Watch her as she does the first treatment in the clinic.
- She should return to the clinic if the infection worsens.

<table>
<thead>
<tr>
<th>FOR THRUSH</th>
</tr>
</thead>
</table>
| - If there are thick plaques the caregiver should:  
  - Wash hands with soap and water.  
  - Wet a clean soft cloth with chlorhexidine 0.2% or salt water, wrap this around the little finger, then gentle wipe away the plaques.  
  - Wash hands again.  
- Give nystatin 1 ml 4 times a day (after feeds) for 7 days.  
- If infant is breastfed,  
  - Check mother’s breasts for thrush. If present treat mother’s breasts with nystatin.  
  - Advise mother to wash nipples and areolae after feeds.  
- If bottle fed, change to cup and make sure that the caregiver knows how to clean utensils used to prepare and give the milk (p. 23 - 25) |

<table>
<thead>
<tr>
<th>FOR CHRONIC EAR INFECTION, CLEAR THE EAR BY DRY WICKING</th>
</tr>
</thead>
</table>
| - Dry the ear at least 3 times daily  
  - Roll clean absorbent cloth or soft, strong tissue paper into a wick.  
  - Place the wick in the child’s ear.  
  - Remove the wick when wet.  
  - Replace the wick with a clean one and repeat these steps until the ear is dry.  
- The ear should not be plugged between dry wicking. |

<table>
<thead>
<tr>
<th>FOR MOUTH ULCERS</th>
</tr>
</thead>
</table>
| - Treat for mouth ulcers 3 - 4 times daily for 5 days:  
  - Give paracetamol for pain relief (p. 40) at least 30 minutes before cleaning the mouth or feeding the child.  
  - Wash hands.  
  - Wet a clean soft cloth with chlorhexidine 0.2% and use it to wash the child’s mouth. Repeat this during the day.  
  - Wash hands again.  
- Advise caregiver to return for follow-up in two days if the ulcers are not improving. |

<table>
<thead>
<tr>
<th>FOR EYE INFECTION</th>
</tr>
</thead>
</table>
| - Wash hands with soap and water  
  - Gently wash off pus and clean the eye with normal saline (or cooled boiled water) at least 4 times a day. Continue until the discharge disappears.  
  - Apply chloramphenicol ointment 4 times a day for seven days.  
  - Wash hands again after washing the eye. |

<table>
<thead>
<tr>
<th>SOOTHE THE THROAT, RELIEVE THE COUGH WITH A SAFE REMEDY</th>
</tr>
</thead>
</table>
| Safe remedies to encourage:  
- Breastmilk  
- If not breastfed and/or older than 6 months, warm water or weak tea can be given. Sugar or honey and lemon can be added, if available  
Harmful remedies to discourage:  
- Herbal smoke inhalation  
- Vicks drops by mouth  
- Any mixture containing vinegar |

ASSESS AND CLASSIFY THE SICK CHILD AGE 2 MONTHS UP TO 5 YEARS
**Counsel the mother or caregiver about home care**

**1. Feeding**

- Counsel the mother to feed her child based on the child’s age and findings of feeding assessment (p. 17 - 23)

**2. When to return**

- Advise caregiver to return immediately if the child has any of these signs:
  - Any sick child: 
    - Becomes sicker
    - Not able to drink or breastfeed
    - Has convulsions
    - Vomiting everything
    - Develops a fever
    - Develops oedema
  - If child has COUGH OR COLD, also return if:
    - Fast breathing
    - Difficult breathing
    - Wheezing
  - If child has DIARRHOEA, also return if:
    - Blood in stool
    - Drinking poorly

**Follow-up visit: Advise caregiver to come for follow-up at the earliest time listed**

**Routine well child visit**

Advise caregiver when to return for next Routine Child visit ..
COUNSEL THE MOTHER OR CAREGIVER ABOUT HOME CARE

3. SUPPORT THE FAMILY TO CARE FOR THE CHILD

- Help the mother, family and caregiver to ensure the child’s needs are met.
- Assess any needs of the family and provide or refer for management.

4. COUNSEL THE CAREGIVER ABOUT HER OWN HEALTH

- If the caregiver is sick, provide care for her, or refer her for help.
- Advise the caregiver to eat well to keep up his/ her own strength and health.
- Encourage caregiver to grow local foods, if possible, and to eat fresh fruit and vegetables.
- Ensure that the child's birth is registered.
- Where indicated, encourage the caregiver to seek social support services e.g. Child Support Grant.
- Make sure the caregiver has access to:
  - Contraception and sexual health services, including HIV testing services.
  - If mother is HIV negative: retest at the 10 week postnatal visit, 6 month visit and every 3 months while breastfeeding.
  - Counselling on STI and prevention of HIV-infection.
  - Any other health or social services she requires.

5. GIVE ADDITIONAL COUNSELLING IF THE MOTHER OR CAREGIVER IS HIV-POSITIVE

- Encourage disclosure: disclosure may improve adherence and viral suppression which is important for all caregivers, including breastfeeding mothers.
- If mother is not on ART: offer same-day ART initiation.
- If mother is on ART: check the mother’s VL and if suppressed repeat VL every 6 months while breastfeeding. If not virally suppressed: follow the VL non-suppression algorithm in national ART guidelines.
- Emphasise the importance of adherence if on ART.
- Emphasise early treatment of illnesses, opportunistic infections or drug reaction.
- Counsel caregiver on eating healthy foods that include protein, fat, carbohydrate, vitamins and minerals.
- Reassure her that with regular follow-up, much can be done to prevent serious illness, and maintain her and the child’s health.
## Give Follow-up Care

- Care for the child who returns for follow-up using ALL the boxes that match the child’s previous classifications.
- If the child has a new problem, assess, classify and treat the new problem as on the **Assess and Classify** Chart.

### Pneumonia and Cough or Cold

**After 2 days**
- Check the child for general danger signs
- Assess the child for cough or difficult breathing
- Ask: - Is the child’s breathing slower?
- Is there less fever?
- Is the child eating better?

**Treatment:**
- If there is chest indrawing or a general danger sign, give first dose of ceftriaxone IM. (p. 35) Also give first dose cotrimoxazole (p. 38) unless the child is known to be HIV-negative. Then **Refer Urgently**.
- If breathing rate, fever and eating are the same, or worse, check if caregiver has been giving the treatment correctly. If yes, refer. If she has been giving the antibiotic incorrectly, teach her to give oral medicines at home. Follow-up in 2 days.
- If breathing slower, less fever or eating better, complete 5 days of antibiotic. Remind the caregiver to give one extra meal daily for a week.

**See Assess & Classify (p. 25)**

### Wheeze - First Episode

**After 2 days (Pneumonia with wheeze), or after 5 days (Cough or Cold with wheeze):**
- If wheezing has not improved, refer.
- If no longer wheezing after 5 days, stop salbutamol. Advise caregiver to re-start salbutamol via spacer if wheezing starts again, and return to clinic immediately if child has not improved within 4 hours.

### Diarrhoea

**After 2 days (for some dehydration) or 5 days (for no visible dehydration, but not improving):**
- Assess the child for diarrhoea.
- Check if zinc is being given.
- If blood in the stools, assess for dysentery.
- Ask: - Are there fewer stools?
- Is the child eating better?
- If SOME DEHYDRATION, refer.
- If diarrhoea still present, but NO VISIBLE DEHYDRATION, follow-up in 5 days.
- Assess and counsel about feeding (p. 17 - 20).
- Advise caregiver when to return immediately (p. 45).

**See Assess & Classify (p. 26)**

### Persistent Diarrhoea

**After 5 days:**
- Ask:
  - Has the diarrhoea stopped?
  - How many loose stools is the child having per day
- Assess feeding

**Treatment:**
- Check if zinc is being given.
- If the diarrhoea has not stopped reassess child, treat for dehydration, then refer.
- If the diarrhoea has stopped:
  - Counsel on feeding (p. 17 - 20).
  - Suggest caregiver gives one extra meal every day for one week.
- Review after 14 days to assess weight gain.

### Dysentery

**After 2 days:**
- Assess the child for diarrhoea. See **Assess & Classify** (p. 26).
- Ask:
  - Are there fewer stools?
  - Is there less blood in the stool?
  - Is there less fever?
  - Is there less abdominal pain?
  - Is the child eating better?

**Treatment:**
- If general danger sign present, or child sicker, **Refer Urgently**.
- If child dehydrated, treat for dehydration, and **Refer Urgently**.
- If number of stools, amount of blood, fever or abdominal pain is the same or worse, refer.
- If child is better (fewer stools, less blood in stools, less fever, less abdominal pain, eating better), complete 3 days of Ciprofloxacin.
- Give an extra meal each day for a week. (p. 17-20)
GIVE FOLLOW-UP CARE

- Care for the child who returns for follow-up using ALL the boxes that match the child’s previous classifications.
- If the child has a new problem, assess, classify and treat the new problem as on the ASSESS AND CLASSIFY Chart.

NOT GROWING WELL

After 14 days:
- Weigh the child and determine if the child is still low weight for age.
- Determine weight gain.
- Reassess feeding (p. 17 - 23).
Treatment:
- If the child is gaining weight well, praise the caregiver. Review every 2 weeks until GROWING WELL.
- If the child is still NOT GROWING WELL:
  - Check for TB and manage appropriately.
  - Check for HIV infection and manage appropriately.
  - Check for feeding problem. If feeding problem, counsel and follow-up in 5 days.
  - Counsel on feeding recommendations.
- If the child has lost weight or you think feeding will not improve, refer. Otherwise review again after 14 days: if child has still not gained weight, or has lost weight, refer.
- Check if the child is accessing other additional care and support (e.g. Social security (grants)).

FEEDING PROBLEM

After 5 days:
- Reassess feeding (p. 17 - 23).
- Ask about feeding problems and counsel the caregiver about any new or continuing feeding problems.
- If child is NOT GROWING WELL, review after 14 days to check weight gain.

ANAEMIA

After 14 days:
- Check haemoglobin.
Treatment:
- If haemoglobin lower than before, refer.
- If haemoglobin the same or higher than before, continue iron. Recommend iron rich diet. Review in 14 days. Continue giving iron every day for 2 months (p. 41).
- If the haemoglobin has not improved or the child has palmar pallor after one month, refer.

SEVERE ACUTE MALNUTRITION (SAM)
WITHOUT MEDICAL COMPLICATION OR MODERATE ACUTE MALNUTRITION (INCLUDING SAM PATIENTS DISCHARGED FROM INPATIENT CARE)

After 7 days:
ASK:
- Is the child feeding well?
- Is the child finishing the weekly amount of RUTF? Are there any new problems?
LOOK FOR:
- General danger signs, medical complications, fever and fast breathing. If present or there is a new problem, assess and classify accordingly.
- Weight, MUAC, oedema and anaemia
- If the child is well and gaining weight, there is no need to repeat the appetite test. If the child is not gaining weight or you are concerned for any reason, repeat the appetite test.
Treatment:
- If any one of the following are present, refer:
  - Any danger sign, RED or YELLOW CLASSIFICATION or other problem
  - Poor response as indicated by:
    - oedema
    - weight loss of more than 5% of body weight at any visit or for 2 consecutive visits
    - static weight for 3 consecutive visits
    - failure to reach the discharge criteria after 2 months of outpatient treatment.
    - Child fails the appetite test
- If there is no indication for referral:
  - Assess for possible HIV and TB infection p. 32 & 33
  - Give a weekly supply of RUTF (p. 41)
  - Counsel the caregiver on feeding her child (p. 23)
  - Give immunisations and routine treatments when due (p. 34)
  - Follow-up weekly until stable
  - Continue to see the child monthly for at least two months until the child is feeding well and gaining weight regularly or until the child is classified as GROWING WELL.

MODERATE ACUTE MALNUTRITION

Routinely providing supplementary foods (RUTF/RUSF) to moderately acute malnutrition to infants and children presenting to primary health-care facilities is not recommended.
Supplementary foods are recommended in the following situations:
- Areas with a high prevalence (new and old cases) of moderate acute malnutrition.
- Children/family who are food and nutrient insecure and/ or where food based approach is not feasible. (no or very little food)
- For this group of children special attention to nutrition counselling, interventions to address food security and follow-up care to assess response is crucial.
GIVE FOLLOW-UP CARE

- Care for the child who returns for follow-up using all the boxes that match the child's previous classifications.
- If the child has a new problem, assess, classify and treat the new problem as on the ASSESS AND CLASSIFY chart (p. 24-34).

FEVER: OTHER CAUSE

If fever persists after 2 days:
Do a full reassessment of the child.
Treatment:
• If the child has any general danger sign or stiff neck or bulging fontanelle, treat for SUSPECTED MENINGITIS (p. 27) and REFER URGENTLY.
• If fever has been present for 7 days, assess for TB. (p. 33)
• Treat for other causes of fever.

MALARIA OR SUSPECTED MALARIA

If fever persists after 2 days:
• Do a full reassessment of the child.
• Assess for other causes of fever.
Treatment:
• If the child has any general danger signs, bulging fontanelle or stiff neck, treat as SUSPECTED SEVERE MALARIA (p. 27) and REFER URGENTLY.
• If malaria rapid test was positive at initial visit and fever persists or recurs, REFER URGENTLY.
• If malaria test was negative at the initial visit, and no other cause for the fever is found after reassessment, repeat the test:
  • If malaria test is negative or unavailable, refer.
  • If malaria rapid test is positive, treat for malaria.
• Treat for any other cause of fever.

MEASLES

If fever persists after 2 days or caregiver complains of new problems, do a full reassessment (p. 24 - 34)
• Look for mouth ulcers and clouding of the cornea
• Check that the child has received two doses of Vitamin A (p. 34)
• Check that the necessary specimens have been sent and that contacts have been immunised.
Treatment:
• If child has any danger sign or severe classification, provide prereferral treatment, and REFER URGENTLY.
• If child is still febrile, has mouth or eye complications, DIARRHOEA WITH SOME DEHYDRATION, PNEUMONIA or has lost weight, refer.
• If child has improved, advise caregiver to provide home care, including providing an extra meal for one week. Make sure she knows When to Return (p. 14 or 45)

POSSIBLE STREPTOCOCCAL INFECTION

After 5 days:
• Assess and monitor dehydration as some children with a sore throat are reluctant to drink or eat due to pain
• Stress the importance of completing 10 days of oral treatment.
• If not improvement, follow-up in 5 more days.
• After 10 days: If symptoms worse or not resolving, refer.

EAR INFECTION

Reassess for ear problem. See ASSESS & CLASSIFY (p. 30).
Treatment:
• If there is tender swelling behind the ear or the child has a high fever, REFER URGENTLY.
ACUTE EAR INFECTION:
After 5 days:
• If ear pain or discharge persists, treat with amoxicillin for 5 more days.
• Continue dry wicking if discharge persists.
• Follow-up in 5 more days.
• After two weeks of adequate wicking, if discharge persists, refer.

CHRONIC EAR INFECTION:
After 14 days:
• If some improvement, continue dry wicking, and review in 14 days
• If no improvement, refer

POSSIBLE STREPTOCOCCAL INFECTION

After 5 days:
• Assess and monitor dehydration as some children with a sore throat are reluctant to drink or eat due to pain
• Stress the importance of completing 10 days of oral treatment.
• If not improvement, follow-up in 5 more days.
• After 10 days: If symptoms worse or not resolving, refer.
GIVE FOLLOW-UP CARE

HIV INFECTION NOT ON ART

All children with confirmed HIV should be initiated on ART.

Children whose caregivers are not willing and able to start ART should be referred to the counselor and social worker to identify obstacles to treatment and should start ART as soon as possible.

The following should be provided at each visit:
- Routine child health care: immunisation, growth monitoring, feeding assessment and counseling and developmental screening.
- Find out why the child is not on ART and counsel appropriately.
- Provide cotrimoxazole prophylaxis (p. 38).
- Assessment, classification and treatment of any new problem.
- Ask about the caregiver’s health. Provide HIV testing and treatment if necessary.

SUSPECTED SYMPTOMATIC HIV INFECTION

Children with this classification should be tested immediately with an age-appropriate HIV test, and reclassified on the basis of their test result.

See the child at least once a month. At each visit:
- Provide routine child health care: immunization, growth monitoring, feeding assessment and counseling, and developmental screening.
- Provide Cotrimoxazole prophylaxis from 6 weeks of age (p. 38).
- Assess, classify and treat any new problem.
- Ask about the caregiver’s health. Provide HIV testing and appropriate treatment.

HIV-EXPOSED: ON ARV PROPHYLAXIS, ONGOING HIV EXPOSURE OR HIV-EXPOSED

See the child at least once every month. At each visit provide:
- Routine child health care: immunisation, growth monitoring, and developmental screening.
- Check that the infant/child has been receiving prophylactic ARVs correctly (p. 12).
- Support the mother to exclusively breastfeed the infant (p. 17 - 18). If the infant is not breastfed, provide counselling on replacement feeding (p. 23-25) and address any feeding problems (p. 21)
- Infants of mothers on 1st line regimens and VL > 1000 copies/ ml:
  - Regain maternal VL suppression as a matter of urgency.
  - Continue breastfeeding.
  - Continue or re-initiate high risk prophylaxis with AZT twice daily for 6 weeks and NVP once daily for a minimum of 12 weeks.
  - NVP should only be stopped once the maternal VL is confirmed to be < 1000 copies/ ml, or until 1 week after all breastfeeding has stopped.
- Infants of mothers on 2nd or 3rd line regimens and VL >1000 copies/ ml:
  - Advise not to breast feed.
  - Arrange replacement feeding through dietitian.
  - Provide cotrimoxazole prophylaxis (p. 38).
  - Assess, classify and treat any new problem.
  - Recheck the child’s HIV status according to the HIV testing schedule (below). Reclassify the child according to the test result, and provide care accordingly.
  - Ask about the caregiver’s health. Provide counselling, testing and treatment as necessary.

HIV TEST

<td>HIV antibody (rapid or ELISA)</td>
</tr>
</tbody>
</table>

NB: All HIV-exposed infants not on ART should be tested/retested.

ASSESS AND CLASSIFY THE SICK CHILD AGE 2 MONTHS UP TO 5 YEARS
GIVE FOLLOW-UP CARE

CONFIRMED OR PROBABLE TB (ON TREATMENT)

- Follow-up monthly.
- Ensure that the child is receiving regular treatment, ideally as Directly Observed Treatment, 7 days a week. Remember to switch to the continuation phase after two months treatment (p. 39).
- Ask about symptoms and check weight.
- If symptoms are not improving or if the child is not growing well, refer.
- Counsel regarding the need for adherence, and for completing six months treatment.
- Counsel and recommend HIV testing if the child’s HIV status is not known.

PALLIATIVE CARE FOR THE CHILD

The decision to provide palliative care only should be made at the referral level. Palliative care includes medication, counselling and support for the child and his family:

- Cotrimoxazole prophylaxis for HIV positive children (p. 38).
- Pain relief
- Routine child care.
- Provide psychosocial support to HIV-positive caregivers and children
- Counsel the caregiver regarding good nutrition, hygiene and management of skin lesions.
- Referral to a community support or home based care group.

TB EXPOSURE (ON TREATMENT)

- Follow-up monthly.
- Ask about symptoms and check weight.
- If symptoms develop, or if child is not growing well, refer.
- Counsel regarding the need for adherence, and for completing six months treatment.
- Ensure that the child is receiving medication, and provide treatment for one month where necessary (p. 38).
INITIATING ART IN CHILDREN: Follow the six steps

STEP 1: RECORD PATIENT DETAILS AND HISTORY

Record the following information in the HIV clinical chart.
- Patient details.
- Caregiver details: Details of primary and secondary caregiver.
- Past medical history:
  - Allergies
  - Mode of transmission
  - ARVs prior to ART start date including PMTCT prophylaxis
  - ART transfer in details
  - Disclosure status
  - Immunisation status (update from RTHB)
  - Past medical history including surgical history

STEP 2: DECIDE IF THE CHILD HAS CONFIRMED HIV INFECTION

Infant/child <18 months:
The first positive PCR test is confirmed with a second positive HIV PCR.
- Proceed to Steps 3 - 6 whilst awaiting second PCR result.

Child >18 months:
Under 2 years: A positive rapid HIV antibody test is confirmed with a positive HIV PCR.
Over 2 years: A positive rapid HIV antibody tests confirmed with a second positive HIV antibody test (rapid or ELISA).
- If the first rapid HIV test is positive and the second test is negative (discordant), do an ELISA or refer.
- Send outstanding tests but proceed to step 3 while awaiting results.

STEP 3: DECIDE IF THE CAREGIVER IS ABLE TO GIVE ART

- Check that the caregiver is willing and able to administer ART.
- Complete psychosocial readiness and social record sections in the HIV clinical chart.
- The caregiver should ideally have disclosed the child's HIV status to another adult who can assist with providing ART (or be part of a support group).
- If caregiver is willing and able to give ART, move to Step 4.
- If not, classify as HIV INFECTION not on ART, and provide care as outlined on p 50.

STEP 4: DECIDE IF A IMCI NURSE SHOULD INITIATE ART

Check for the following:
- General danger signs or any severe classification
- Infant <1 month of age
- Child weighs less than 3 kg
- TB
- Fast breathing
- Any WHO stage 4 condition
- If any of these are present, refer to next level of care for ART initiation.
- If none present, move to Step 5.

STEP 5: ASSESS AND RECORD BASELINE INFORMATION

- Nutrition assessment:
  - Weight, height/length, head circumference (if <2 years), MUAC.
  - BMI or WFH z-score. Classify based on findings.
  - Assess and classify for anaemia (p. 31).
  - TB screening and TB contacts (p. 33)
- Developmental screening, school attendance and school performance.
- WHO clinical staging.
- Baseline laboratory investigations:

<table>
<thead>
<tr>
<th>BASELINE INVESTIGATIONS</th>
<th>DONE FOR</th>
</tr>
</thead>
<tbody>
<tr>
<td>CD4 count and FBC/Hb</td>
<td>All children starting ART.</td>
</tr>
<tr>

<td>Children/adolescents starting tenofovir (TDF).</td>
</tr>
<tr>
<td>Alanine Aminotransferase (ALT)</td>
<td>On TB treatment or starting nevirapine (NVP).</td>
</tr>
</tbody>
</table>

- If the child has SEVERE ACUTE MALNUTRITION, SEVERE ANAEMIA (Hb < 7 g/dl) or TB refer to the next level of care for management and for initiation of ART.
- If Hb is 7 g/dl - 11 g/dl, classify as ANAEMIA and treat (p. 31). Do not delay starting ART.
- Send any outstanding laboratory tests. If the child already meets the criteria for starting

STEP 6: START ART

- ART regimens always include 3 drugs.
- See ART dosing and instructions)
  - p. 52-59).
- Remember to counsel the caregiver on how to give the drugs and possible side-effects.
- Remember to give cotrimoxazole (p. 38).
- Give other routine treatments (p. 34).
- Follow-up after one week.

**ADAPTED WHO CLINICAL STAGING**

- All children with CONFIRMED HIV INFECTION must be staged at diagnosis and as part of regular follow-up.
- Children are staged in order to monitor their progress on ART.
- If in doubt, discuss the child with a colleague or refer.

<table>
<thead>

• Pneumocystis pneumonia (PCP/ PJP)  
• Kaposi sarcoma  
• Extrapulmonary TB |
ABACAVIR (ABC) GIVE ONCE OR TWICE DAILY

- Tablets (except 60mg) must not be chewed, divided or crushed. They should be swallowed whole, with or without food.
- A hypersensitivity (allergic) reaction to abacavir may occur in a very small number of children. This usually happens in the first six weeks of treatment.
  - Symptoms tend to worsen in the hours immediately after the dose, and worsen with each subsequent dose.
  - Common side-effect symptoms include fever and rash (usually raised and itchy), gastrointestinal symptoms (nausea, vomiting, abdominal pain) and respiratory symptoms (dyspnoea, sore throat, cough).
  - If the child has at least 2 of the above, do NOT stop the medicine but call for advice or refer URGENTLY.
  - If a hypersensitivity reaction is confirmed, abacavir will be stopped.
  - A child who has had a hypersensitivity reaction must never be given abacavir again. Make sure that the reaction is recorded, and that the patient knows that he/she should never take abacavir again.

LAMIVUDINE (3TC) GIVE ONCE OR TWICE DAILY

- Lamivudine is very well tolerated and can be taken with or without food.
- Tablets are scored and can be easily divided. They may be crushed and mixed with a small amount of water or food—if this is done they must be given immediately.
- Side-effects are minimal, but include headache, tiredness, abdominal pain and red cell aplasia.
- If side-effects are mild, continue treatment.
- If the child has severe symptoms, REFER URGENTLY.

One ABC/3TC (600/300 mg) combination tablet once daily
STARTING ART FOR CHILDREN

All children should receive three drugs in their ART regimen (p. 52)

LOPINAVIR/ RITONAVIR (LPV/R)
MUST BE GIVEN TWICE DAILY

- The solution should be stored in a fridge. However it can be stored at room temperature up to 25°C for up to 6 weeks.
- Give with food (a high-fat meal is best).
- May need techniques to increase tolerance and palatability: coat mouth with peanut butter, dull taste buds with ice, follow dose with sweet foods.
- Tablets must not be chewed, divided or crushed. Swallow them whole, with or without food.
- Side-effects include nausea, vomiting and diarrhoea. Continue if these are mild.
- There are many drug interactions, and doses must be adjusted for children on TB medicines (e.g. TB drugs).

</tbody>
</table>

DOLUTEGRAVIR (DTG) GIVE ONCE DAILY

- Dolutegravir belongs to a ARV drug class called integrase inhibitors.
- It is not recommended for children and adolescents weighing <20kg.
- Dolutegravir is well tolerated and can be taken with or without food.
- Can be taken in the morning or in the evening according to preference, but if the patient develops insomnia it should be taken in the morning.
- Side-effects are usually mild and self-limiting, but may include insomnia, headache, central nervous system (CNS) effects, gastrointestinal effects, and weight gain.
- There is a possible association between Dolutegravir and increased risk of neural tube defects (NTD) if taken in the first six weeks of a pregnancy. Extra care must be taken among girls/women living with HIV desiring pregnancy or who may be at risk of pregnancy for any reason.
- Standard Dose:
  - Children ≥20kg and <35kg regardless of age: 50 mg daily (combined with ABC and 3TC)
  - Children/ adolescents ≥35kg and ≥10 years of age: 50 mg daily (combined with TDF and 3TC in the fixed dose formulation TLD).

<table>

**STARTING ART FOR CHILDREN**

All children should receive three drugs in their ART regimen (p. 52)

---

**TENOFOVIR (TDF) GIVE ONCE DAILY**

- Tenofovir is not recommended for children/adolescents <10 years old and weighing < 35kg.
- Tenofovir is well tolerated can be taken with or without food in the morning or in the evening.
- Uncommon but important side effects of Tenofovir include reduced bone density and reduced kidney function.
- Creatinine and estimated GFR are done before starting Tenofovir and then monitored at month 3, 6 and 12, and thereafter every 12 months.
- If eGFR <80 ml/min: start or change to ABC in place or TDF and refer.
- Estimated GFR will need to be calculated for children/adolescents 10–<16 years:
  \[ \text{eGFR (ml/min)} = \text{height (cm)} \times 40 \times \text{creatinine (μmol/l)}. \]

---

**EFAVIRENZ (EFV) GIVE ONCE DAILY AT NIGHT**

- Efavirenz is not recommended in children <3 years and weighing <10 kg.
- Can be taken with or without food, but avoid giving with fatty foods.
- Tablets must not be chewed, divided or crushed. They should be swallowed whole.
- Capsules may be opened and powder content dispersed in water or mixed with a small amount of food (e.g. yogurt, to disguise peppery taste) and immediately ingested.
- Side-effects include skin rash, sleep disturbances and confusion/abnormal thinking. REFER children who develop these symptoms.
- Best given at bed time to reduce central nervous side effects, especially during the first two weeks.

---

PROVIDE FOLLOW-UP FOR CHILDREN ON ART:
Follow the seven steps

STEP 1: ASSESS AND CLASSIFY

- Ask: Does the child have any problems?
- Has the child received care at another health facility since the last visit?
- Check for General Danger Signs (p. 24)
  - Severe skin rash
  - Difficulty breathing and severe abdominal pain
  - Yellow eyes
  - Fever, vomiting, rash (only if on abacavir)
- Check for main symptoms (p. 5 - 10 or 24 - 31). Treat and follow-up accordingly.
- Consider (screen for) TB: Assess, classify and manage (p. 33)
- If child has TB, refer to next level of care.

STEP 2: MONITOR PROGRESS ON ART

ASSESS AND CLASSIFY FOR NUTRITION AND ANAEMIA (P. 30 AND 31):
- Record the child’s weight, height and head circumference.

ASSESS DEVELOPMENT:
- Decide if the child is: developing well, has some delay or is losing milestones.

ASSESS ADHERENCE:
- Ask about adherence and how often, if ever, the child misses a dose.
- Record your assessment.

ASSESS DRUG RELATED SIDE-EFFECTS:
- Ask about side-effects. Ask specifically about the side-effects in the table on p. 59.

ASSESS CLINICAL PROGRESS: (P. 53)
- Assess the child’s stage of HIV infection
- Compare with the stage at previous visits.

MONITOR BLOOD RESULTS: (P. 58)
- Record results of tests that have been sent. Send tests that are due (p. 58).

IF ANY OF THE FOLLOWING ARE PRESENT, REFER THE CHILD (NON-URGENTLY)

- Not gaining weight for 3 months despite nutritional supplements.
- Loss of milestones.
- Poor adherence despite adherence counselling.
- Significant side-effects despite appropriate management.
- Higher WHO stage than before (clinical deterioration).
- Any WHO stage 4 condition.
- CD4 count significantly lower than before or < 50 cells/mL.
- Viral load >1000 copies despite adherence counselling.
- Total non-fasting cholesterol >3.5 mmol/L.
- TGs >1.6 mmol/L.
- Other abnormal clinical or lab findings. Manage mild side-effects (p. 59).

STEP 3: CHECK FOR VIRAL SUPPRESSION AND PROVIDE ART

VIRAL LOAD MONITORING:
- If VL is between 50 -1000 copies/mL, begin step-up adherence support and repeat VL after 3 months.
- If VL is >1000 copies/mL, begin step-up adherence support and repeat VL after 3 months.

If the repeat VL is:
- <50 copies/mL, return to routine VL monitoring.
- 50-1000 copies/mL, continue step-up adherence support and repeat VL after 6 months.
- >1000 copies/mL, refer the child to be managed for possible treatment failure.

PROVIDE ART
- Check ARV doses — these will need to increase as the child grows.
- Check if child is eligible to transition onto a new ARV regimen. See p. 52 and 59.

STEP 4: PROVIDE OTHER HIV TREATMENTS

- Provide cotrimoxazole prophylaxis (p. 38).
- Remember to stop when it is no longer needed.

STEP 5: PROVIDE ROUTINE CARE

- Check that the child’s immunisations are up to date (p. 34).
- Provide Vitamin A and deworming if due (p. 34).

STEP 6: COUNSEL THE CAREGIVER

- Use every visit to educate and provide support to the caregiver.
- Key issues to discuss include: How the child is progressing, feeding, adherence, side-effects and correct management, disclosure (to others and to the child), support for the caregiver, access to CSG and other grants.
- Ask about the health of the mother, father, and siblings. Remember that VL suppression is critical in all family members living with HIV.

STEP 7: ARRANGE FOLLOW-UP CARE

- If the child is well, make an appropriate follow-up date in 1-3 months time, taking into account repeat medication, blood results and clinical check ups.
- If there are any problems, follow-up more frequently.
## Routine Laboratory Tests

- Laboratory tests that should be routinely sent are shown in the table below.
- Always make sure that the results are correctly recorded in the child’s records and Paediatric and Adolescent Stationery.
- Make sure that you act on the tests: if you are unsure discuss the test results with a colleague or refer the child.

<table>
<thead>
<tr>
<th>TEST</th>
<th>WHEN SHOULD IT BE DONE</th>
<th>VIRAL LOAD (VL)</th>
<th>RESPONSE</th>
</tr>
</thead>
</table>
| CD4 count and percentage | At ART initiation. | Lower than detectable limits (LDL) or <50 copies/mL | - Praise the patient and caregiver(s).  
- Continue VL monitoring according to normal schedule.  
- Continue routine follow up and adherence support. |
| | After 12 months on ART. | | |
| | Thereafter every 6 months until the child meets the criteria to discontinue cotrimoxazole prophylaxis. | | |
| | If not virally suppressed, monitor CD4 count 6 monthly. | | |
| Viral load (VL) | After 6 months on ART. | 50 - 1,000 copies/mL | - Begin step up adherence package.  
- Repeat VL in 3 months.  
- Thereafter monitor VL according to | |
| | Thereafter, if virally suppressed, every 12 months. | | |
| | If not virally suppressed, address adherence, repeat VL after 3 months and reassess. | | |
| Hb or FBC | At initiation/ before change to 2nd line ART. | >1,000 copies/mL | - Begin step-up adherence package.  
- Repeat VL in 3 months:  
  - If <50: Return to routine monitoring as above.  
  - If 50 - 1,000: Continue step up adherence support and repeat VL after 6 months.  
  - If VL still >1000: Refer to doctor visiting the clinic or local hospital if no visiting doctor.  
| | If less than 8 g/dl refer to next level of care. | | |
| | If on AZT (1st or 2nd line ART): | | |
| Non-fasting total cholesterol and triglycerides | For children on Protease Inhibitor based regimens (LPV/r, ATV/r, DRV/r) | Creatinine and creatinine clearance (Cr Cl) | For children/ adolescents on tenofovir (TDF) | |
| | After 3 months on ART | | | |
| | Then every 12 months thereafter, if within normal/ acceptable range. | | | |
| Creatinine and creatinine clearance (Cr Cl) | For children/ adolescents on tenofovir (TDF) | | | |
| | At initiation | | | |
| | At month 3, 6 and 12 | | | |
| | Thereafter, repeat every 12 months. | | | |

## Adherence Principles

- Very high levels of adherence (>95%) should be attained for adequate virological response and prevention of viral resistance.
- This can be achieved with regular education and support.
- All efforts to encourage this level of adherence should be made.
- Viral load measurements are useful for monitoring adherence.
SWITCHING CHILDREN AND ADOLESCENTS BETWEEN FIRST LINE ART REGIMENS

- If a child is taking an old ARV regimen, change to the corresponding new regimen once the child meets the criteria for switching.
- Make sure all the requirements for switching are met (age, weight, Viral Load (VL), renal function if switching to TDF).
- If the child is taking a regimen with LPV/r, make sure this is a first line regimen. Do not switch if the child/adolescent is on a second line regimen.
- If the child did not have a VL in the last 6 months, do not do additional VL outside the routine monitoring. Wait for the result of the next routine VL before switching.
- For adolescent girls in childbearing age, provide information on risks and benefits of DTG (p. 55) to enable the girl/caregiver to make an informed choice to either stay on EFV or switch to DTG.
- Dose according to the paediatric ART dosing chart

<table>
<thead>
<tr>
<th>TEST</th>
<th>CURRENT first line regimen</th>
<th>NEW FIRST LINE REGIMEN</th>
<th>REQUIREMENTS BEFORE SWITCHING</th>
</tr>
</thead>
</table>
| Infants >4 weeks of age and >42 weeks gestational age | AZT + 3TC + NVP | ABC + 3TC + LPV/r | • VL is not required before switching.  
• If body weight is <3 kg, obtain expert advice on dosing. |
| Children and adolescents weighing ≥20 kg | ABC + 3TC + LPV/r* OR ABC + 3TC + EFV | ABC + 3TC + DTG | • VL <1000 copies/mL tested within the previous 6 months is a requirement before switching.  
• If VL >50 copies/mL, provide enhanced adherence counselling.  
• If VL >1000 copies/mL on 2 successive tests, refer to doctor. |
| Children and adolescents weighing ≥35 kg and ≥10 years of age | ABC + 3TC + LPV/r* OR ABC + 3TC + EFV | TDF + 3TC + DTG | • VL <1000 copies/mL tested within the previous 6 months is a requirement before switching.  
• Estimated GFR >80 mL/min is required for starting TDF.  
• If VL >50 copies/mL, provide enhanced adherence counselling.  
• If VL >1000 copies/mL on 2 successive tests, refer to doctor. |

* Ensure that the patient is taking a first line regimen with LPV/r and not a second line regimen.
## SIDE EFFECTS OF ARVs

<table>
<thead>
<tr>
<th>SIGNS/SYMPTOMS</th>
<th>MANAGEMENT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yellow eyes (jaundice) or abdominal pain</td>
<td>• Stop medicines and REFER URGENTLY.</td>
</tr>
</tbody>
</table>
| Rash                                   | • If on abacavir, assess carefully. Are there any signs & symptoms of Abacavir hypersensitivity: Is there any fever, nausea, vomiting, diarrhoea or abdominal pain? Is there generalized fatigue or achiness? Is there any shortness of breath, cough or pharyngitis? If the child has at least 2 of the above, do NOT stop medicine but call for advice or refer URGENTLY.  
• If on efavirenz or nevirapine:  
  • If the rash is severe and associated with symptoms such as fever, vomiting, oral lesions, blistering, facial swelling, conjunctivitis and skin peeling, STOP all mediciness and refer URGENTLY.  
  • If the rash is mild to moderate, with no systemic symptoms; the medicine can be continued with no interruption but under close observation. |
| Nausea and vomiting                     | • Advise that the medicines should be given with food. If persists for more than 2 weeks or worsens, call for advice or refer. If vomiting everything, or vomiting associated with severe abdominal pain or difficult breathing, REFER URGENTLY. |
| Diarrhoea                               | • Assess, classify and treat using diarrhoea charts (p. 4, 26, 42-43). Reassure caregiver that if due to ARV, it will improve in a few weeks. Follow-up as per Chart Booklet (p. 47). If not improved after two weeks, call for advice or refer. |
| Fever                                   | • Assess, classify and manage according to Fever Chart (p. 3, 27).                                                                                                                                  |
| Headache                                | • Give paracetamol (p. 40). If on efavirenz, reassure that this is common and usually self-limiting. If persists for more than 2 weeks or worsens, call for advice or refer. |
| Sleep disturbances, nightmares, anxiety | • This may be due to efavirenz. Give at night; counsel and support (usually lasts less than 3 weeks). If persists for more than 2 weeks or worsens, call for advice or refer. |
| Tingling, numb or painful feet/legs     | • If new or worse on treatment, call for advice or refer.                                                                                                                                          |
| Changes in fat distribution             | • Ask about and look for changes in appearance, especially thinness around the face and temples and excess fat around the tummy and shoulders.  
  • If child on stavudine: Substitute stavudine with abacavir if VL is less than 50 copies/mL. If VL is greater than 50 copies/mL or if the child is not on stavudine, REFER.  
  • If child develops enlarged breasts (lipomastia) which is severe and/or occurs before puberty, REFER. |
### Identify Skin Problems

#### Look

<table>
<thead>
<tr>
<th>Signs</th>
<th>Classify</th>
<th>Treat</th>
<th>Features in HIV Infection</th>
</tr>
</thead>
</table>
| • Itchy papules at different stages of evolution.  
• Found on the arms and legs.  
• Healed lesions are often dark/ hyper pigmented.  
• The itch is difficult to manage.  
• May flare after starting ART, but generally improves as the CD4 count increases.  
• Essential to exclude scabies. | Papular Urticaria  
Or Papular Pruritic Eruptions | • Trim finger nails and avoid scratching.  
• Apply 1% hydrocortisone to new, inflamed lesions for five days.  
• Give oral antihistamine to relieve itch:  
  - Short term use: Chlorphenamine, oral, 0.1mg/kg/ dose 6-8 hourly  
  - Long term use for children 2-6 years: Cetirizine, oral, 5mg once daily  
  - Caution: Do not give antihistamines to children < 2 years of age.  
• Refer if no improvement after 2 weeks or if underlying malignancy or systemic disease is suspected. | • Is a clinical stage 2 defining case (p. 53)  
• Consider HIV infection in all cases. |
| • An itchy circular lesion with a raised edge and fine scaly area.  
• Scalp lesions may result in loss of hair. | Ringworm (Tinea) | • Avoid sharing clothes, towels and toiletries (e.g. brushes and combs) to prevent spreading the infection to others.  
• Wash and dry skin well before applying treatment.  
• Apply an imidazole (e.g. clotrimazole 1% cream) three times daily until two weeks after lesions have cleared.  
• For scalp infections (tinea capitis) give oral fluconazole 6mg/kg once daily for 28 days. | • Extensive: there is a high incidence of co-existing nail infection which has to be treated adequately to prevent recurrence of tinea infections of skin.  
• Fungal nail infection is a clinical stage 2 defining disease (p. 53). |
| • Intense itching, more severe at night.  
• Small burrows between fingers, toes, elbow areas and buttocks.  
• Secondary infection may occur.  
• Small babies may have vesicles and pustules on the palms and soles and face.  
• The infestation spreads easily, usually affecting more than one person in the household. | Scabies | • All close contacts should be treated simultaneously (even if not itchy).  
• Wash all bed linen and underwear in hot water  
• Expose all bedding to direct sunlight.  
• Put on clean clothes after treatment.  
**In children 6 yrs and older**  
• Apply benzyl benzoate 25% from the neck to the toes.  
  Allow the lotion to remain on the body for 24 hours, then wash off using soap and water.  
**If benzyl benzoate is unsuccessful or in children > 6 yrs**  
• Apply permethrin 5% lotion. Leave on overnight and wash off in the morning (may be repeated after one week).  
• Treatment may need to be repeated after one week.  
• Treat secondary bacterial infection if present. | • HIV-positive children, may present with crusted scabies - extensive areas of crusting mainly on the scalp, face, back and feet.  
• Patients may not complain of itching. |
### Identify Skin Problems

<table>
<thead>
<tr>
<th>Look</th>
<th>Signs</th>
<th>Classify</th>
<th>Treat</th>
<th>Features in HIV Infection</th>
</tr>
</thead>
</table>
| ![Chicken Pox](chicken_pox.png) | • Mild fever preceding the rash.  
• Rash begins on the trunk and face, later spreads to the arms and legs.  
• Vesicles appear progressively over days and forms scabs after they rupture.  
• Contagious from the fever starts until all lesions have crusted.  
• Usually lasts for about 1 week. | **Chicken Pox** | • Limit contact with other children and pregnant women until all lesions have crusted.  
• Ensure adequate hydration.  
• Cut fingernails short and discourage scratching.  
• Treat itching:  
  - Apply calamine lotion  
  - In severe cases, give an oral antihistamine: Chlorphenamine 0.1 mg/kg/dose 6–8 hourly NB: only children >2 years).  
• Refer urgently if severe rash or complications (e.g. pneumonia, jaundice, meningitis, myocarditis, hepatitis). | • Atypical presentation in immunocompromised children.  
• May last longer.  
• Complications like secondary bacterial infection, myocarditis, hepatitis, encephalitis, meningitis and pneumonia are more frequent.  
• Chronic infection with continued appearance of new lesions for >1 month;  
• Typical vesicles evolve into non-healing ulcers that become necrotic and crusted. |
| ![Herpes Zoster](herpes_zoster.png) | • Vesicles in one area on one side of body with intense pain or scars plus shooting pain.  
• They are uncommon in children except when they are immune-compromised. | **Herpes Zoster** | • Keep lesions clean and dry.  
• Acyclovir 20 mg/kg 4 times daily for 7 days.  
• Give paracetamol for pain relief (p. 40).  
• Follow up in 7 days.  
• Refer if disseminated disease, involvement of the eye, pneumonia or features meningitis.  
• Monitor for secondary bacterial infection. | • Duration of disease longer.  
• Haemorrhagic vesicles, necrotic ulceration.  
• Rarely recurrent, disseminated or multidermatomal.  
• A clinical stage 2 defining disease (p. 53). |
| ![Impetigo](impetigo.png) | • Pustules and papules with honey-coloured crusts.  
• Commonly starts on the face or buttocks, then spreads to the neck, hands, arms and legs. | **Impetigo** | • Good personal and household hygiene to avoid spread of infection.  
• Wash and soak sores in soapy water to soften and remove crusts.  
• Apply antiseptic 8 hourly: Povidone Iodine 5% cream or 10% ointment.  
• Drain pus if fluctuant.  
• Give antibiotic if extensive lesions: Cephalexin, oral, 12-25mg/kg/dose 6 hourly OR Flucloxacillin, oral, 500mg 6 hourly.  
• Refer urgently if child has fever and or if infection extends to the muscles. |
### IDENTIFY SKIN PROBLEMS | NON-ITCHY

<table>
<thead>
<tr>
<th>LOOK</th>
<th>SIGNS</th>
<th>CLASSIFY</th>
<th>TREAT</th>
<th>FEATURES IN HIV INFECTION</th>
</tr>
</thead>
</table>
| ![Image](https://via.placeholder.com/150) | • Caused by a poxvirus.  
• Dome-shaped papules with a central depression (umbilication).  
• Most commonly seen on the face and trunk in children. | MOLLUSCUM CONTAGIOSUM | • Allow to heal spontaneously if few in number.  
• Apply a tincture of iodine BP to the core of individual lesions using an applicator.  
• Refer children with:  
  - Extensive lesions  
  - No response to treatment  
  - Lesions close to the eye (to an ophthalmologist). | • Incidence is higher.  
• More than 100 lesions may be seen.  
• Lesions often chronic and difficult to eradicate.  
• Extensive molluscum contagiosum indicates Stage II HIV disease (p. 53). |
| • Appears as papules or nodules with a rough surface.  
• Seen most often on the hands and fingers, but can be found anywhere on the body. | WARTS | • May be left alone to wait for improvement  
• Apply salicylic acid 15-20% to the warts.  
  - Protect surrounding skin with petroleum jelly  
  - Apply daily to the wart and allow to dry  
  - Occlude for 24 hours  
  - Soften lesions by soaking in warm water, and remove loosened keratin.  
  - Repeat process daily until the warts disappear.  
• Refer if extensive. | • Lesions are numerous and recalcitrant to therapy.  
• Extensive viral warts indicates Stage II HIV disease (p. 53). |
| • Greasy scales and redness on central face, body folds.  
• The scalp, face, ears and skin folds (e.g. axillae, groins, under the breasts) are commonly affected. | SEBORRHOEIC DERMATITIS | • Apply hydrocortisone 1% cream to the face and flexures.  
• For scalp itching, scaling and dandruff: wash hair and scalp 2-3 times a week with selenium sulphide 2.5% suspension.  
• If severe, REFER. | • May be severe in HIV infection.  
• Secondary infection may occur. |
# Clinical Reactions to Medicines

## Look

<table>
<thead>
<tr>
<th>Signs</th>
<th>Classify</th>
<th>Treat</th>
<th>Features in HIV Infection</th>
</tr>
</thead>
</table>
| • One or more dark round or oval skin lesions with central vesicles.  
  • The lesions recur on the same spot, and increase in number with each successive attack. | **Fixed Drug Reaction** | • Stop the offending medication.  
  • In mild cases, apply 1% hydrocortisone for five days.  
  • Discuss all cases with a doctor. | • Could be a sign of reactions to ARVs or clotrimazole (See also p. 59). |

<table>
<thead>
<tr>
<th>Signs</th>
<th>Classify</th>
<th>Treat</th>
<th>Features in HIV Infection</th>
</tr>
</thead>
</table>
| • Erythematous (red), sometimes scaly plaques found on the face, flexures, trunk and extensors.  
  • Yellow pustules which crust indicate secondary bacterial infection. | **Eczema** | • Bath in warm water using soap substitutes only once daily.  
  • Dry skin gently.  
  • Apply Hydrocortisone 1% cream followed by application of moisturizer (emulsifying ointment).  
  • Treat itching oral chlorphenamine 0.1 mg/kg/dose 6–8 hourly  
  • Treat secondary infection: Cephalexin, oral, 12–25 mg/kg/dose 6 hourly for 5 days OR: Flucloxacillin, oral, 12–25 mg/kg/dose 6 hour-ly for 5 days.  
  • Refer if:  
    - severe acute moist or weeping eczema is present  
    - no improvement after two weeks  
    - Secondary herpes infection (eczema herpeticum) is suspected | • Lesions are numerous and recalcitrant to therapy. |

<table>
<thead>
<tr>
<th>Signs</th>
<th>Classify</th>
<th>Treat</th>
<th>Features in HIV Infection</th>
</tr>
</thead>
</table>
| • Severe and acute reaction due to many drugs, the commonest being cotrimoxazole or nevirapine.  
  • Lesions involve the skin as well as the mucous membranes (e.g. eyes, mouth and genitalia).  
  • May start as widespread red irregular rash with or without blisters. The blisters rupture leaving denuded areas of skin.  
  • May cause difficulty in breathing. | **Steven Johnson Syndrome (SJS)** | • Stop medication  
  • REFER URGENTLY  
  • Assess for dehydration (p. 26) and give fluids according to plan A, B or C (p. 42-43).  
  • Give pain relief (Paracetamol p. 40). | • May be caused by a number of drugs including nevirapine, cotri-moxazole, efavirenz, antiepileptics, antibiotics, antifungals and traditional medications.  
  • HIV and other infections predispose patients to SJS. |
## Developmental Screening

### For Health Workers...

**At every visit:** Ask the parents or caregiver if they have any specific concerns about how their child hears, sees, communicates, learns, behaves, interacts with others and uses their hands, arms, legs and body.

Tick the boxes above if the caregiver says that the child **CAN** do the following or if it was **OBSERVED** during the visit. Try to elicit the behaviour or movement if not observed through spontaneous play and interaction.

If the child can complete the task, tick the box ✓. If the child cannot complete the task, cross the box ✗. If you were unable to assess the task, indicate ND (not done) next to the relevant task.

### Referred To:

- Speech therapy
- Audiology
- Doctor
- Occupational therapist
- Physiotherapist

If specified health professional not available, refer to one of the following health professionals for an initial developmental assessment: Doctor/physiotherapist/occupational therapist/speech therapist.
**BOYS: Weight-for-height charts**

This Weight-for-Length Chart shows body weight relative to length/height in comparison to the Median (the green line).

- A boy whose weight-for-length/height is above the +3 (red) line, is **obese**.
- A boy whose weight-for-length/height is above the +2 (orange) line, is **overweight**.
- A boy whose weight-for-length/height is below the –2 line (orange), is **wasted**.
- A boy whose weight-for-length/height is below the –3 line (red), is severely **wasted (SEVERE ACUTE MALNUTRITION)**. Refer for urgent specialised care.

**BOYS: Weight-for-age charts**

Write on the chart:
- Any illness e.g. diarrhea, ARI, etc.
- Admission to hospital
- Solid food introduced
- Breastfeeding stopped
- Birth of next sibling, etc.

Watch the direction of the arrow showing the child's growth:

- **GOOD**:
  - Means the child is growing well
- **NORMAL**: Reference line
- **WARNING**: Stunted growth
- **DANGEROUS**: Stunted growth, severe acute malnutrition
- **Very dangerous**: Severe acute malnutrition
  - Refer child to hospital

**Birth to 1 year**

**Birth Weight**

<table>
<thead>
<tr>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
<th>9</th>

</tr>
</tbody>
</table>
**BOYS: Weight-for-age charts**

**1 to 2 years**

**2 to 3 years**

**3 to 4 years**

**3 to 5 years**

**Interpretation of lines:**
- This Weight-for-Age Chart shows body-weight relative to age in comparison to the Median (green line).
- A boy whose weight-for-age is below the orange -2 line, is underweight.
- A boy whose weight-for-age is below the red -3 line, is severely underweight.
- If his line crosses a z-score line and the shift is away from the median, this may indicate a problem or risk of a problem.
- If his line shifts away from his birth trend line, this may indicate a problem or a risk of a problem.
**BOYS: Height-for-age charts**

**birth to 5 years**

**FOR PERIODIC USE**
(every 6 months)

INTERPRETATION OF LINES

This Length/Height-for-Age Chart shows height relative to age in comparison to the Median green (0-line)

A boy whose length/height-for-age is below the orange -2 line, is stunted

A boy whose length/height-for-age is below the red -3 line, is severely stunted
GIRLS: Weight-for-age charts

- This Weight-for-Age Chart shows body-weight relative to age in comparison to the Median (0-line).
- A girl whose weight-for-age is below the orange (-2 line), is underweight.
- A girl whose weight-for-age is below the red (-3 line), is severely underweight.
- If her line crosses a z-score line and the shift is away from the median, this may indicate a problem or risk of a problem.
- If her line shifts away from her birth trend line, this may indicate a problem or a risk of a problem.
**INTERPRETATION OF LINES**

This Length/Height-for-Age Chart shows height relative to age in comparison to the Median green (0-line). A girl whose length/height-for-age is below the orange -2 line, is **stunted**. A girl whose length/height-for-age is below the red -3 line, is **severely stunted**.

---

**GIRLS: Weight-for-age charts**

- **3 to 5 years**
- **3 to 4 years**
- **4 to 5 years**

---

**GIRLS: Height-for-age charts**

- **birth to 5 years**
- **3 to 5 years**
- **3 to 4 years**
- **4 to 5 years**
**GIRLS:** Weight-for-height chart

This Weight-for-Height/Length Chart shows body weight relative to length/height in comparison to the Median (the 0.5-score line).
- A girl whose weight-for-length/height is above the (red) +3 line, is **obese**.
- A girl whose weight-for-length/height is above the (orange) +2 line, is **overweight**.
- A girl whose weight-for-length/height is below the (orange) -2 line, is **wasted**.
- A girl whose weight-for-length/height is below the (red) -3 line, is **severely wasted** (SEVERE ACUTE MALNUTRITION). Refer for urgent specialised care.
CARE OF YOUNG INFANT AGED BIRTH UP TO 2 MONTHS

**CHECK:** Is the baby just been delivered? If yes, follow the Helping Babies Breathe approach

**ASK:** Does the child have any problems? If yes, record here: ________________________________________________________________

**ASK:** Has the child received care at another health facility since birth? If yes, record here: ________________________________________________________________

### CHECK FOR POSSIBLE BACTERIAL INFECTION AND JAUNDICE (ALL YOUNG INFANTS, CB p. 3)

<table>

</tbody>
</table>

If infant has not been seen by health worker before, CHECK FOR CONGENITAL PROBLEMS (CB p. 5)

- Check Mother RPR results
  - Positive
  - Negative
  - Unknown

If positive, Mother is
- Untreated
- Partially treated
- Tx completed > a month before delivery

Check for Priority Signs:
- Cleft lip or palate
- Imperforate anus
- Ambiguous Genitalia
- Nose not patent
- Macrocephaly
- Abdominal distension
- Very low birth weight (≤ 2kg)

Check Head and Neck
- Microcephaly
- Fontanelle or sutures abnormal

- Swelling of scalp, abnormal shape
- Neck Swellings, webbing
- Face, Eyes, Mouth or nose abnormal
- Unusual appearance
- Other problems

Check Limbs and Trunk
- Abnormal position of limbs
- Club foot
- Abnormal Fingers and toes, palms
- Abnormal chest, back and abdomen
- Undescended testis or hernia

### CONSIDER RISK FACTORS IN ALL YOUNG INFANTS (CB p. 6)

- Signs/symptoms of congenital TB
- Mother is on TB treatment
- Admitted to hospital for more than three days after delivery
- Infant weighed less than 2 kg at birth
- Known neurological or congenital problem

- Mother has died or is ill
- Infant not breastfed
- Teenage caregiver
- Social deprivation

### CONSIDER HIV INFECTION (CB p. 7)

- Has the child had an HIV (PCR) test?
  - No test
  - Pos test
  - Neg test

If test is negative, is the child being breastfed (or breastfed in the 6 weeks before the test was done)?

- Yes
- No

If child not tested, has the mother had an HIV test?

- No test
- Pos test
- Neg test

ALWAYS classify:
THEN CHECK FOR FEEDING PROBLEM OR POOR GROWTH (all young infants; CB p. 8-9)

<table>
<thead>
<tr>
<th>Description</th>
<th>No</th>
<th>Yes</th>
<th>Times in 24 hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>Breastfeeding</td>
<td>no</td>

</tr>
</tbody>
</table>

If yes, what do you use to feed the baby?
__________________________________

Plot weight for age
- Low weight
- Not low weight

Weight gain
- Satisfactory
- Unsatisfactory

ALWAYS classify:
- Thrush

If the young infant has any difficulty feeding, or is feeding less than 8 times in 24 hours, taking any other food or drinks, or is low weight for age AND has no indication to refer urgently to hospital, assess breastfeeding (CB p. 8 or 9). Record findings on the back of the recording form.

CHECK THE YOUNG INFANT’S IMMUNISATION STATUS (All young infants; CB p. 10): Underline those already given - Tick those needed today

<table>
<thead>
<tr>
<th>Age</th>

If the young infant has any difficulty feeding, or is feeding less than 8 times in 24 hours, taking any other food or drinks, or is low weight for age AND has no indication to refer urgently to hospital, assess feeding (CB p. 8, 9). Record findings here.

ASSESS BREASTFEEDING

Breastfed in previous hour?  ○ yes  ○ no

If the mother has not fed in the previous hour, ask the mother to put the child to the breast

Observe the breastfeed for four minutes, check attachment:
- Chin touching breast  ○ yes  ○ no
- Mouth wide open  ○ yes  ○ no
- Lower lip turned out  ○ yes  ○ no
- Not attached  ○ Not well attached  ○ Good attachment
- More areola above than below the mouth  ○ yes  ○ no
- Not attached  ○ Not attached  ○ Good attachment
- Is the young infant suckling effectively (that is, slow deep sucks, sometimes pausing)?
- Not sucking at all  ○ Not sucking effectively  ○ Suckling effectively

If an HIV positive mother has chosen not to breastfeed:

Which breastmilk substitute is the infant receiving?

Is enough milk being given in 24 hrs?  ○ yes  ○ no

Correct feed preparation?  ○ yes  ○ no

Any food or fluids other than formula?  ○ yes  ○ no

Feeding utensils?  ○ cup  ○ bottle

Utensils cleaned adequately?  ○ yes  ○ no
## Child Age 2 Months Up to 5 Years

### Name: ____________________________  Age: ______  HC: ______  Weight: ______ kg  Temp: ______ °C  Date: ____________________

What are the child's problems? _____________________________________________________________  ○ Initial Visit  ○ Follow-up Visit

### Check for General Danger Signs

<table>
<thead>
<tr>
<th>Always classify:</th>
<th>○ yes  ○ no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not able to drink or breastfeed  ○ Convulsions during this illness  ○ Vomits everything  ○ Lethargic or unconscious</td>
<td></td>
</tr>
</tbody>
</table>

### Cough or Difficult Breathing?

<table>
<thead>
<tr>
<th>○ yes  ○ no</th>
</tr>
</thead>
<tbody>
<tr>
<td>For how long? _____ days  Counted _____ breaths per minute  ○ Fast breathing  ○ Chest indrawing  ○ Stridor  ○ Wheeze</td>
</tr>
</tbody>
</table>

If wheeze, ask:  ○ Wheeze before this illness  ○ Wheeze for more than 7 days  ○ Frequent cough at night  ○ Treatment for asthma at present

### Diarrhoea?

<table>
<thead>
<tr>
<th>○ yes  ○ no</th>
</tr>
</thead>
<tbody>
<tr>
<td>General condition:  ○ Lethargic or unconscious  ○ Restless or irritable  ○ Sunken eyes  ○ Not able to drink/drinking poorly  ○ Drinking eagerly, thirsty</td>
</tr>
</tbody>
</table>

Pinched abdomen skin goes back:  ○ Normal  ○ Goes back slowly  ○ Goes back very slowly (> 2 secs)

### Fever (by history or feel or 37.5°C or above)?

<table>
<thead>
<tr>
<th>○ yes  ○ no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stiff neck  ○ Bulging fontanelle</td>
</tr>
</tbody>
</table>

Malaria Risk. If malaria risk:  ○ Malaria Test:  ○ Positive  ○ Negative  ○ Not done

### Measles?

<table>
<thead>
<tr>
<th>○ yes  ○ no</th>
</tr>
</thead>
<tbody>
<tr>
<td>○ Fever  ○ Measles rash  ○ Runny nose, or Cough or Red eyes  ○ Contact with measles  ○ Pneumonia  ○ Symptomatic HIV infection</td>
</tr>
</tbody>
</table>

Cornea clouded  ○ Deep mouth ulcers  ○ Mouth ulcers  ○ Eyes draining pus

### Ear Problem?

<table>
<thead>
<tr>
<th>○ yes  ○ no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ear pain  ○ Wakes child at night?  ○ Pus seen draining from ear.  ○ Ear discharge reported: for _____ days  ○ Tender swelling behind the ear</td>
</tr>
</tbody>
</table>

### Sore Throat?

<table>
<thead>
<tr>
<th>○ yes  ○ no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Runny nose  ○ Cough  ○ Rash</td>
</tr>
</tbody>
</table>

### Check for Malnutrition

<table>
<thead>
<tr>
<th>Always classify:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weight</td>
</tr>
<tr>
<td>○ Very Low Weight  ○ Losing weight  ○ Weight gain unsatisfactory  ○ Weight gain satisfactory</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Weight for Height/length</th>
</tr>
</thead>
<tbody>
<tr>
<td>○ z-score &lt; -3  ○ z-score ≥3 and &gt;-2  ○ z-score ≥ 2 or more</td>
</tr>
</tbody>
</table>

Ht:_____

<table>
<thead>
<tr>
<th>All children</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oedema of both feet  ○ Yes  ○ No</td>
</tr>
</tbody>
</table>

### Check for Anaemia

<table>
<thead>
<tr>
<th>Always classify:</th>
</tr>
</thead>
<tbody>
<tr>
<td>○ Severe Pallor  ○ Some Pallor  ○ No Pallor</td>
</tr>
</tbody>
</table>

If pale, Haemoglobin measured ______ gm / dl

---
CONSIDER HIV INFECTION
All children
Has the child had an HIV test? If yes, what was the result? ○ Pos HIV test ○ Neg HIV test
If Test Positive: is child on ART ○ yes ○ no
If no test, has the mother had an HIV test? ○ No test ○ Pos HIV test ○ Neg HIV test
And: ○ Pneumonia now ○ Unsatisfactory weight gain ○ Persistent diarrhoea now or in past 3 months ○ Oral thrush
○ Ear discharge now or in the past ○ Parotid enlargement ○ Low weight for age ○ Enlarged glands in 2 or more of: neck, axilla or groin

TB RISK  All children ○ Close TB contact ○ Cough for 3 weeks ○ Loss of weight ○ Fever for 7 days ○ NOT GROWING WELL
All children with HIGH RISK OF TB or RISK OF TB must have full TB assessment and be classified

ASSESS CHILD’S FEEDING  if anaemia, not growing well or age < two years
How are you feeding your child?
○ Breastfed: ________ times during the day. ○ Breast fed during the night
○ Given other milk: ____________ type. Using ___________________________ to give the milk.
Other milk given __________ times per day. Amounts of other milk each time:__________________________
○ Given other food or fluids. These are: ____________________________________________________________
These given __________ times per day. Using ___________________________ to give other fluids.
○ Feeding changed in this illness. If yes, how? _______________________________________________________
If Not Growing Well: How large are the servings? ___________________________________________________
○ Own serving given. Who feeds the child and how? ___________________________________________________

CHECK IMMUNISATION STATUS  AND GIVE ROUTINE TREATMENTS
Underline those that have been given.
Tick those already given
Birth 6 weeks 10 weeks 14 weeks 6 months 9 months 12 months 18 months 6 years
○ BCG ○ DaPT-IPV-HB-Hib1 ○ DaPT-IPV-HB-Hib2 ○ DaPT-IPV-HB-Hib3 ○ DaPT-IPV-HB-Hib4 ○ Td
○ OPV0 ○ OPV1
○ PCV1 ○ Measles1 ○ Measles2
○ PCV2
○ PCV3
Vitamin A ○ Yes ○ No
Mebendazole ○ Yes ○ No

ASSESS OTHER PROBLEMS:
TREAT THE SICK YOUNG INFANT
Refer any child who has a danger sign, even if no other severe classification.
IMCI PROCESS FOR ALL YOUNG INFANTS (Birth up to two months)
